2.2.3 PC Mode

2.2.3.1 Preface

The transceiver is programmed using a personal computer, a programming interface (KPG-46A/46U) and FPU (programming software).

The programming software can be used with a PC. Figure 1 shows the setup of a PC for programming.

2.2.3.2 Connection procedure

- (1) Connect the transceiver to the computer using the interface cable.

Note:

- (2) You must install the KPG-46U driver in the computer to use the USB programming interface cable (KPG-46U).
- (2) When the Power is switched on, you can immediately enter user mode. When the PC sends a command, the transceiver enters PC mode, and "Pc" is displayed on the LED. When data is transmitting from the transceiver, the red LED blinks. When data is receiving by the transceiver, the green LED blinks.

Note:

The data stored in the computer must match the "Model Name" when it is written into the EEPROM.

2.2.3.3 KPG-46A description

(PC programming interface cable: Option)

The KPG-46A is required to interface the transceiver to the computer. It has a circuit in its D-sub connector (KPG-46A: 9-pin) case that converts the RS-232C logic level to the TTL level. The KPG-46A connects the 8-pin microphone connector of the transceiver to the RS-232C serial port of the computer.

2.2.3.4 KPG-46U description

(USB programming interface cable: Option)

The KPG-46U is a cable which connects to a USB port on a computer.

When using the KPG-46U, install the supplied CD (with driver software) in the computer. The KPG-46U driver runs under Windows XP, Vista, 7 or 8.

The latest version of the USB driver is available for download from the following URL:

<http://www.kenwood.com/usb-com/>

(This URL may change without notice.)

2.2.3.5 Programming Software: KPG-175D description

The FPU is the programming software for the transceiver supplied on a CD. This software runs under Windows XP, Vista, 7 or 8 on a PC.

The data can be input to or read from the transceiver and edited on the screen. The programmed or edited data can be printed out. It is also possible to tune the transceiver.

2.2.4 Clone Mode

Programming data can be transferred from one transceiver to another by connecting them via their cloning cable. The operation is as follows (the transmit transceiver is the source and the receive transceiver is a target).

Note:

Clone mode should be enabled.

- (1) Turn the source transceiver power ON with the [M] key held down (2 seconds), "cL" is displayed on the LED.
- (2) Power on the target transceiver.
- (3) Connect the cloning cable (No. E30-3382-05) to the modular microphone jacks on the source and target.
- (4) Press the [S] key on the source transceiver.

The data of the source is sent to the target. While the source is sending data, red LED blinks.

While the target is receiving the data, "Pc" is displayed and green LED blinks. When cloning of data is completed, the source displays "En", and the source red LED turned off, and the target automatically operates in the User mode. The target can then be operated by the same program as the source.

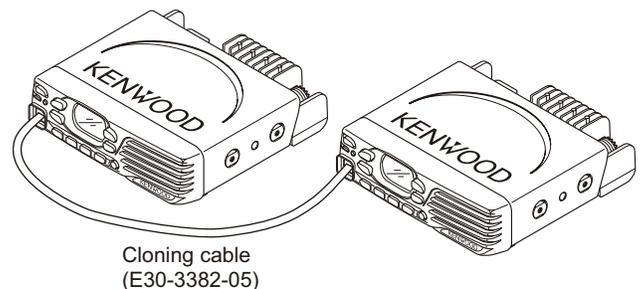

- (5) The other target can be continuously cloned. Carry out the operation in step 2 to 4.

2.2.4.1 Adding the data password.

If the data password is set in the optional feature menu, you must enter the password (Source transceiver) to activate a clone mode.

You can use 0~9 to configure the password. The maximum length of the password is 6 digits.

- (1) [M] + Power ON.
- (2) "PS" is displayed on the LED.
- (3) If the [A] and [M] keys is pressed while "PS" is displayed, numbers (0 to 9) are displayed flashing. When you press the [C>] key, the currently selected number is determined. If you press the [S] key after entering the password in this procedure, "cL" is displayed if the entered password is correct. If the password is incorrect, "PS" is redisplayed.

The internal FET switch can be controlled by turning the HA function on/off and by using a signaling decode output. The maximum current of HA is 2A. This FET switch is the open drain circuit. Therefore, a DC power supply is necessary to use the HR1. The voltage range is from 5V to 16V.

2.3.3 Ignition Sense Cable (KCT-18: Option)

The KCT-18 is an optional cable for enabling the ignition function. The ignition function lets you turn the transceiver power on and off with the car ignition key.

2.3.3.1 Installing the KCT-18 (Ignition sense cable) in the transceiver

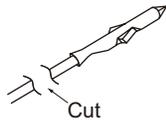

- (1) The KCT-18 can be installed in the transceiver by the following two methods (Method A, Method B).

Method A: The KCT-18 is soldered to the "IGN" pad on the TX-RX unit.

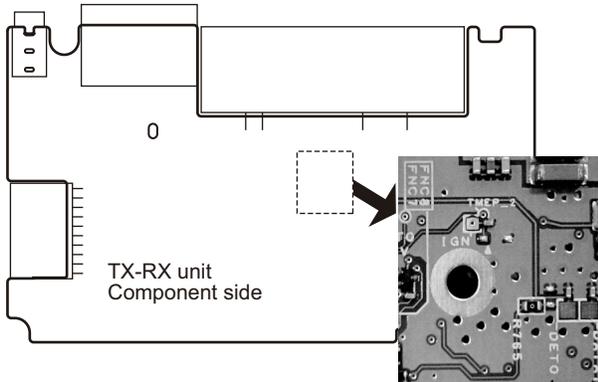

Method B: The KCT-18 is connected to the 15-pin connector of the KCT-60 connected to the transceiver.

■Installation Procedure: Method A

- (1) Remove the two screws on both the right and left sides of the transceiver, then remove the cabinet and top packing from the transceiver.
- (2) Cut the crimp terminal side of the KCT-18 using a pair of nippers or similar tool.

- (3) Solder the cable side cut in the above step 3 to the "IGN" pad on the TX-RX unit.

- (4) Dress the KCT-18 cable as shown in the figure. The KCT-18 cable needs to pass through one of two indentations located on the rear panel of the transceiver.
- (5) Cut off the projection of the top packing using a pair of nippers or similar tool.

If the KCT-18 cable is dressed to be routed through the indentations on the right side in step 5, the right side of the projection needs to be cut off. If the KCT-18 cable is dressed to be routed through the indentations on the left side, the left side of the projection needs to be cut off. Following is a figure presenting an example for when the right side of the projection is cut off.

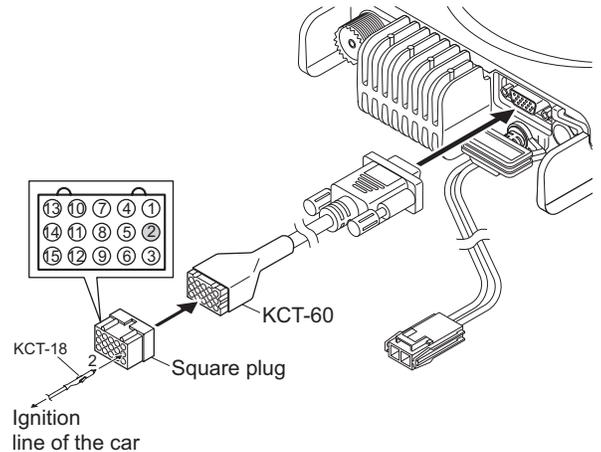

- (6) Reinstall the top packing. Check the correct fitting of the top packing, then reinstall the cabinet and two screws for the right and left sides.
- (7) Connect the other side of the KCT-18 to the ignition line of the car.

■Installation Procedure: Method B

- (1) Remove the ACC. cap on the rear of the transceiver.
- (2) Connect the D-sub connector of the KCT-60 to the D-sub 15-pin terminal of the transceiver.

2.4 CIRCUIT DESCRIPTION

2.4.1 Frequency Configuration

The receiver utilizes double conversion. The first IF is 49.95MHz and the second IF is 450kHz. The first local oscillator signal is supplied from the PLL circuit.

The PLL circuit in the transmitter generates the necessary frequencies. Figure 1 shows the frequencies.

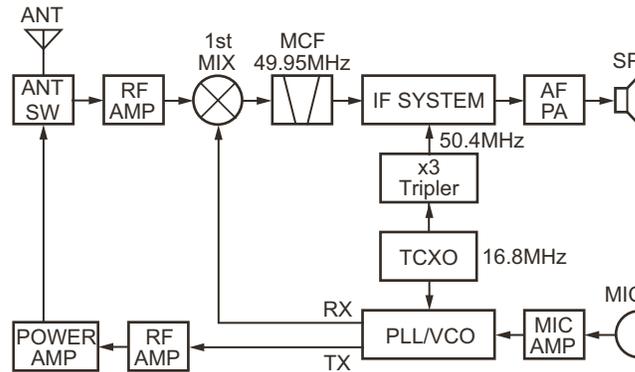

Fig.1 Frequency configuration

2.4.2 Receiver System

The receiver is double conversion superheterodyne.

The frequency configuration is shown in Figure 1.

Fig.2 Receiver system

2.4.2.1 Front-end RF Amplifier

An incoming signal from the antenna is applied to an RF amplifier (Q506) after passing through a transmit/receive switch circuit (D305, D306, D309 and D310), BPF (L512, L513, and varactor diodes: D504, D505).

After the signal is amplified (Q506), the signal is filtered by a BPF (L506, L507, L508 and varactor diodes: D501, D502, D503) to eliminate unwanted signals before it is passed to the first mixer.

The voltage of these diodes are controlled by the TVC according to the channel frequency. (See Figure 2)

2.4.2.2 First Mixer

The signal from the RF amplifier is heterodyned with the first local oscillator signal from the PLL frequency synthesizer circuit at the first mixer (Q503) to create a 49.95MHz first intermediate frequency (1st IF) signal. The first IF signal is then fed through one pair of monolithic crystal filter (MCF: XF500) to further remove spurious signals.

2.4.2.3 IF Amplifier Circuit

The first IF signal is amplified by Q501, and enters IC501 (FM processing IC). The signal is heterodyned again with a second local oscillator signal within IC501 to create a 450kHz second IF signal. The second IF signal is fed through a 450 kHz filter in IC501 to further eliminate unwanted signals before it is amplified and FM detected in IC501.

2.4.2.4 AF Signal System

The detection signal from FM IC (IC501) goes to the baseband IC (IC709) DISC input (pin 16) after pass through IC500 for characterizing the signal.

- **Analog signal**

The demodulated AF signal pass through IC709 with the signal processing and output at AUDIO (pin26) to the E-Vol before the Audio amplifier (IC719). The AF signal from IC719 switches between the internal speaker and speaker jack (J701) output.

- **NXDN (Digital signal)**

The recovered 4L-FSK signal obtained from IC501 is decoded in the baseband IC (IC709).

Decoded signal is fed into microprocessor (IC714) and converted to PCM audio signal, and return to baseband IC (IC709) for converting to audio signal.

This audio signal will output at AUDIO (pin26) to the E-Vol before the Audio amplifier (IC719).

The AF signal from IC719 switches between the internal speaker and speaker jack (J701) output.

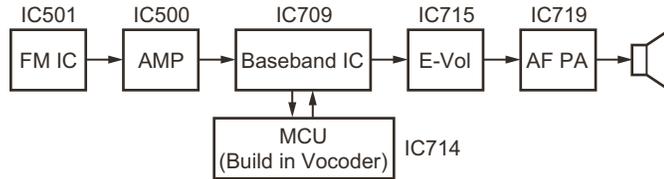

Fig.3 AF signal system

2.4.2.5 Squelch Circuit

Part of the AF signal goes a rectifier circuit to produce a DC voltage corresponding to the noise level after filtering and amplification. This DC voltage send to MCU (IC714) SQIN input pin.

The MCU controls squelch according to the voltage (SQIN) level.

The signal from the RSSI pin of IC501 is monitored. The electric field strength of the receive signal can be known before the SQIN voltage is input to the MCU, and the scan stop speed is improved.

Fig.4 Squelch circuit

2.4.3 Transmitter System

2.4.3.1 Outline

The transmitter circuit produces and amplifies the desired frequency directly. It FM-modulates the carrier signal by means of a varicap diode.

Fig.5 Transmitter system

2.4.3.2 Power Amplifier Circuit

The transmit output signal from the VCO passes through the transmission/reception selection diode (D16) and amplified by Q300. The amplified signal goes to the RF power module (IC300) through a low-pass filter.

The lowpass filter removes unwanted high-frequency harmonic components, and the resulting signal is goes the antenna terminal.

2.4.3.3 APC Circuit

The automatic transmission power control (APC) circuit detects part of a final amplifier output with a coupler circuit and applies a voltage to IC301.

IC301 compares the APC control voltage (APCC) generated by the baseband IC (IC709) and DC amplifier (IC503) with the detection output voltage.

IC301 generates the voltage to control IC300 and stabilizes transmission output.

The APC circuit is configured to protect over current of Q300 and IC300 due to fluctuations of the load at the antenna end and to stabilize transmission output at voltage and temperature variations.

Fig.6 APC circuit and Power amplifier circuit

2.4.4 PLL Frequency Synthesizer

The PLL circuit generates the first local oscillator signal for reception and the RF signal for transmission.

2.4.4.1 PLL Circuit

The frequency step of the PLL is 2.5, 5.0, 6.25 or 7.5 kHz. A 16.8MHz reference signal is divided at IC2 by a fixed counter to produce the reference frequency.

The voltage controlled oscillator (VCO) feedback output is divided by a programmable counter in IC2.

The 2 signals are phase compared, filtered through a low pass filter and passed to VCO to control the oscillator frequency.

2.4.4.2 VCO Circuit

The operating frequency is generated by Q7 in transmit mode and Q5 in receive mode.

The oscillator frequency is controlled by applying the control voltage, which is obtained from the phase comparator, to varactor diodes (D5, D6, D9, D10, D11 in transmit mode and D7, D8, D12, D13, D14 in receive mode).

The TX/RX pin is set "High" in receive mode causing turn on Q9. And T/R pin is set "Low" in transmit mode causing turn on Q6.

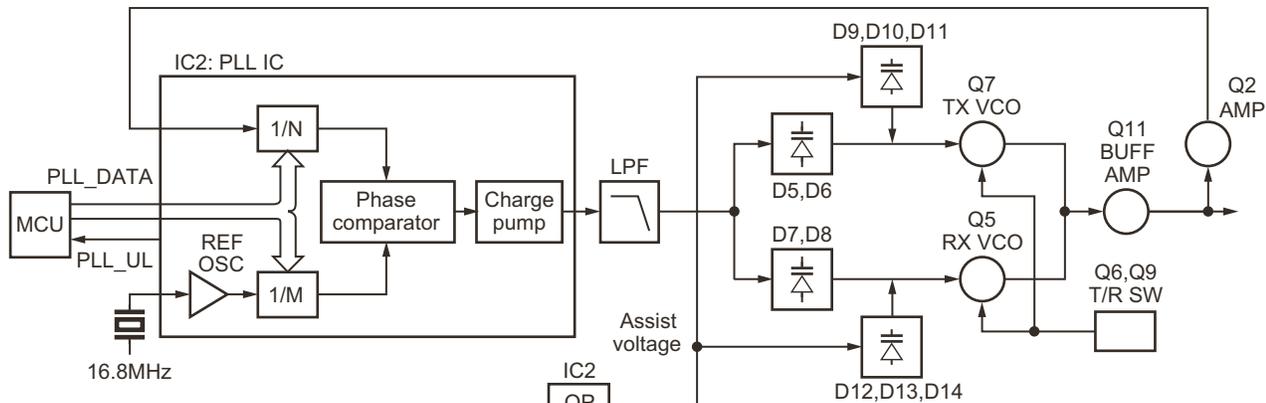

Fig.7 PLL and VCO circuit

2.4.4.3 Unlock Circuit

If low level appears at the "LD" pin of IC2, then PLL an unlock condition occurs.

It causes the voltage applied to the "PLL_UL" pin of the microprocessor to go low.

When the microprocessor detects this condition, the transmitter is disabled by ignoring the push-to-talk switch input signal.

2.4.5 Control Circuit

The MCU carries out the following tasks:

- (1) Controls the FM IC (IC501).
- (2) Controls the baseband IC (IC709).
- (3) Controls the PLL (IC2) & TX/RX outputs.
- (4) Controls IO expender through I2C level converter.
- (5) Controls the display unit.

Fig.8 Control circuit

2.4.5.1 Memory Circuit

The transceiver has an 256k-bit EEPROM (IC716). The EEPROM contains adjustment data. The MCU (IC714) controls the EEPROM through three serial data lines.

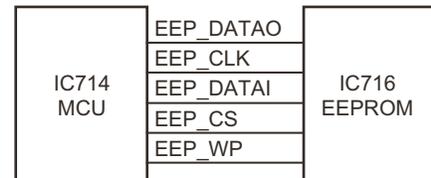

Fig.9 Memory circuit

2.4.5.2 Display Circuit

The MCU (IC714) controls the Display 7-segment LED and LEDs.

When power is on, the MCU will use the MBL line to control the key backlight LEDs.

When the transceiver is busy, the GLED line goes high, Q1 turns on and the green LED (D23) lights after Q4 turn on. In transmit mode, the RLED line goes high, Q2 and Q8 turns on and the red LED (D23) lights.

BLED will be set high when the function select (FPU setting) is on, Q6 turn on and the blue LED (D22) lights.

The dimmer function is controlled by the switch Q5. The LED driver (IC1) controls the functions of the 7-segment LED through the LEDI, LECE, LECL, LELH lines from the MCU.

Fig.10 Display circuit

2.4.5.3 Key Matrix Circuit

The front panel has function keys. Each of them is connected to a cross point of a matrix of the KMI1 to KMO3 ports of the microprocessor.

The KMO1 to KMO3 ports are always high, while the KMI1 to KMI3 ports are always low.

The microprocessor monitors the status of the KMI1 to KMO3 ports. If the state of one of the ports changes, the microprocessor assumes that the key at the matrix point corresponding to that port has been pressed.

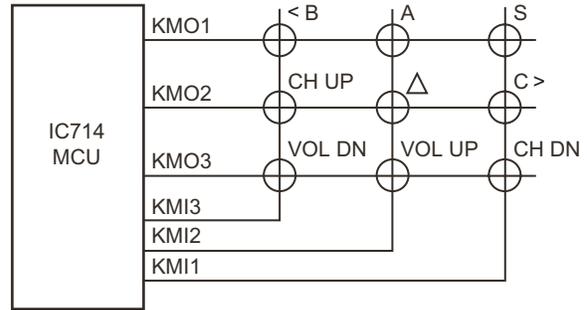

Fig.11 Key matrix circuit

2.4.6 Signaling Circuit

2.4.6.1 Encode

(1) Low-speed data (QT, DQT)

Low-speed data is output from pin 40 (LSDO) of the MCU (IC714).

The signal passes through a low-pass CR filter. The signal is mixed with the audio signal and goes to the VCO and TCXO (X1) modulation input after signal processing in the baseband IC (IC709).

(2) High-speed data (2-tone)

High-speed data (HSD) is output from pin 41 (HSDO) of the MCU.

The signal passes through a low-pass CR filter. TX deviation making an adjustment by microprocessor is applied to the baseband IC (IC709).

The signal is mixed with the audio signal and goes to the VCO and TCXO.

The side tone is audio output of baseband IC(IC709) at the same time to audio power amplifier and then to the speaker.

(3) MSK / DTMF

MSK and DTMF signal is self generated by the baseband IC (IC709).

The TX deviation adjustment is done by the output gain of baseband IC (IC709), and is routed to the VCO.

When encoding MSK/DTMF, the microphone-input signal is muted.

Fig.12 Encode

2.4.6.2 Decode

(1) Low-speed data (QT, DQT)

The demodulated signal from the FM IC (IC501) will input to baseband IC(IC701) to remove frequency above 300Hz.

The signal is input to pin 26 (LSDI) of the MCU.

The MCU digitizes this signal, performs processing such as DC restoration, and decodes the signal.

(2) High-speed data (2-tone)

The demodulated signal from the FM IC (IC501) is amplified by baseband IC and passes through a band-pass filter in IC709 to remove frequency of 3kHz or above and 300Hz or below.

The MCU digitizes this signal and decodes the signal after receive the signal at pin 27(HSDI).

(3) MSK / DTMF

The demodulated signal from the FM IC(IC501) will input to baseband IC(IC709), then the baseband IC will decode and send the decode information to MCU by the data line.

The MCU then processes the decoded information.

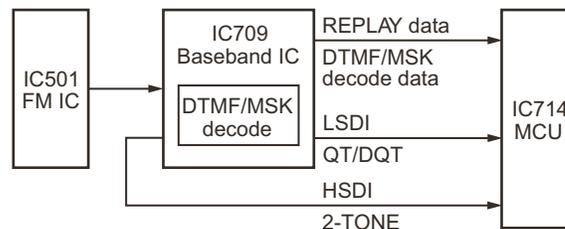

Fig.13 Decode

2.4.6.3 NXDN Receiving

- For Digital Data Mode:
The demodulated signal from IC501 (Pin13) feed into baseband IC (Pin 16) for NXDN decoding.
The decoded digital data will pass to MCU through C-BUS. MCU determines whether or not to output sound from speaker by checking if the data match.
- For Digital Voice Mode:
If the digital data match in MCU, the digital voice payload data will goes into Vocoder in MCU for conversion to PCM.
The PCM data will go to baseband IC through SPI input, where it will be converted to analog by DAC.
Analog voice will be filtered and finally send to audio amplifier.

2.4.7 Power Supply Circuit

- When the power switch on the display unit is pressed, the power port on the display unit which is connected pin 140 (POWKEY), goes low, then pin88 (SBC) goes high, Q718 turns on, SB SW (Q719) turns on and power (SB) is supplied to the transceiver.
- When the DC power supplied to the transceiver, the voltage regulator IC (IC720 & IC718) and supply into the MCU VDD and reset voltage detect IC (IC723). IC723 will generate signal (RESET) into the reset terminal on the MCU (IC714) to carry out a power on reset.
- When the DC power voltage decreases from normal voltage, the INT voltage detector IC (IC722) will set to high on MCU port 141 (BATT_INT). If B line becomes less than about 8.5V, MCU will send the backup data to EEPROM (IC716) and go into STOP mode. This circuit has an overvoltage protection circuit. If a DC voltage of 18V or higher is applied to the base of Q712, this voltage turns Q712 on and sets port 141 (BATT_INT) to low. As a result port 88 (SBC) is low, and turns Q719 and Q720 (SB) off.

SECTION 3 DISASSEMBLY

3.1 Disassembly Procedure

- (1) When removing the cabinet, first remove the two screws from the right and left with a phillips screwdriver. Then, hook your finger on the edge of the cabinet and pull it out until it is over the chassis protrusion. Remove the cabinet by prying the cabinet as shown below.

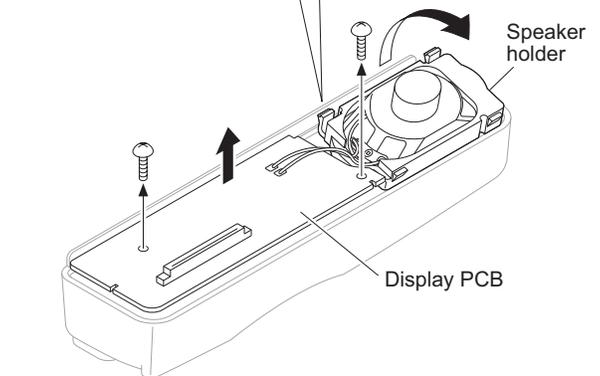

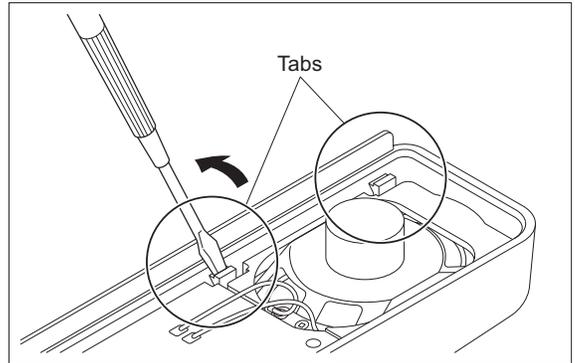

- (2) To remove the panel assembly, first turn the transceiver upside down. Then, insert a flat-head screwdriver into the holes of the chassis and tilt it in the direction as shown by the arrow.

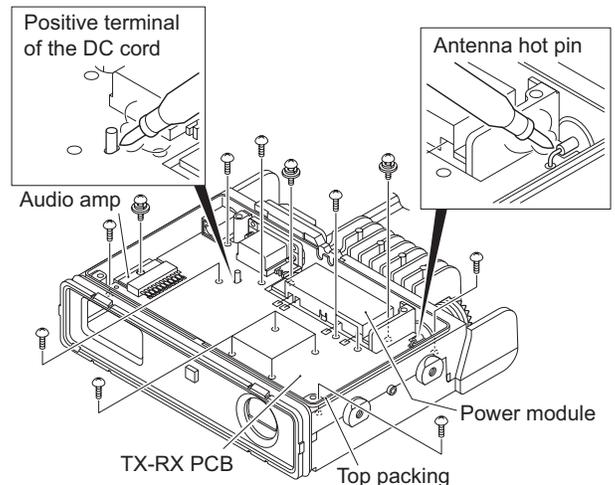

- (3) Disconnect the flat cable from connector of the panel assembly.

- (4) To remove the speaker holder, first remove the two screws from the display PCB using a phillips screwdriver. Then, insert a flat-head screwdriver under the tabs of the speaker holder and tilt it in the direction shown by the arrow.

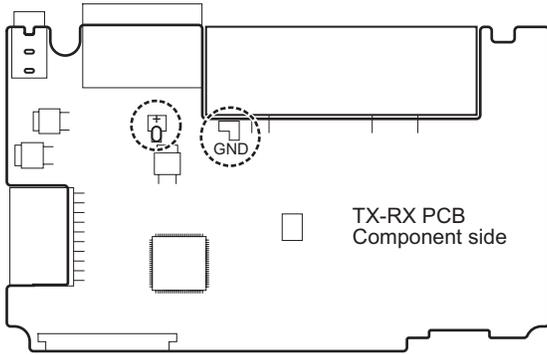

- (5) When removing the TX-RX PCB, first remove the top packing. Then, remove the solder of the antenna hot pin and positive terminal of the DC cord. Remove the 15 screws from the TX-RX PCB, power module, and audio amp.

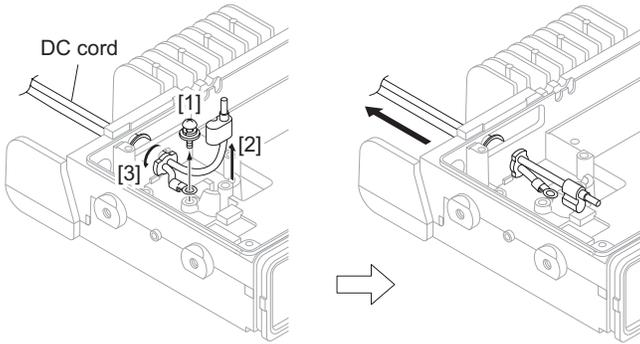

Note:

When you supply power to the TX-RX PCB after removing the TX-RX PCB from the chassis, solder the positive and ground terminals of the DC cord (Recommendation: E30-3448-25) to the + and GND terminals of the TX-RX PCB.

(6) Pull it out behind the chassis by rotating the bush [3] of the DC cord 90 degrees in the direction of the arrow after the screw [1] in the negative terminal is removed, and the positive terminal [2] is removed from the chassis.

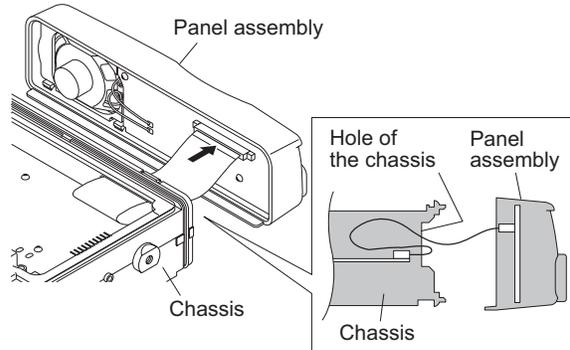

3.2 Precautions for Reassembly

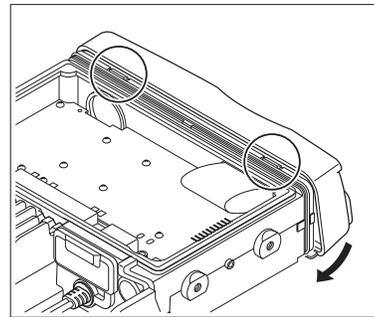

(1) When mounting the speaker holder, while suppressing the speaker rear part (shaded area), fix the four tabs of the speaker holder into the hollows of the front panel in order ([1], [2], [3], and [4]). Then, tighten the two screws of the display PCB.

(2) When mounting the panel assembly, pass the flat cable through the hole of the chassis as shown below then connect the flat cable to connector of the panel assembly.

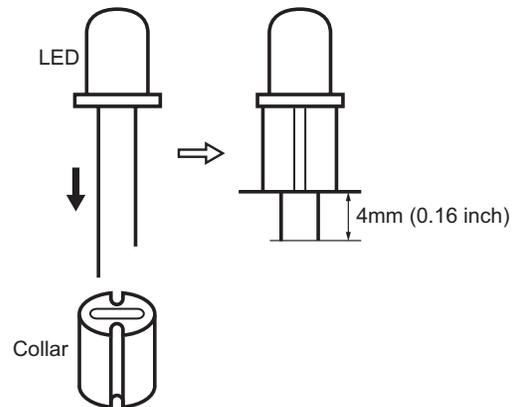

(3) Fit the panel assembly into the two tabs of the chassis top side first. Then, fit the panel assembly into the two tabs of the chassis bottom side by turning the panel assembly.

3.3 Correspondence when replacing the LED (B30-2321-05)

When replacing the LED (B30-2321-05), cut the leg of the LED to 4mm (0.16 inch) after installing the Collar (J31-0565-15).

Before attempting to tune the transceiver, connect the unit to a suitable power supply.

Whenever the transmitter is tuned, the unit must be connected to a suitable dummy load (i.e. power meter).

The speaker output connector must be terminated with a 4Ω dummy load and connected to an AC voltmeter and an audio distortion meter or a SINAD measurement meter at all times during tuning.

NXDN ESN	The same number as the Model Name Plate label is written.

■Model Name Plate Label Layout

■After Changing the PCB

- (1) Using the KPG-175D, select your desired item (Model Name and Frequency) from the Model> Product Information menu, then use Program> Write Data to the Transceiver to write the FPU data (PC Programming mode). When writing to the transceiver, a Warning Message, corresponding to the item selected, appears. Click [OK] to continue writing the data.
- (2) Enter Program> Test Mode, then adjust the various adjustment data (PC Test Mode) as described in the "SECTION 4 ADJUSTMENT"
- (3) Attach the new labels corresponding to the new printed circuit board. (Refer to the images right for label placement.)
- (4) If necessary, write the FPU data used by the customer with the KPG-175D.

Note:

- When a new printed circuit board is used, the KENWOOD ESN changes, as does the Transceiver Information display of the KPG-175D, but this does not have any effect on the operation of the transceiver.
- If changing to the original ESN, please contact our service center.
