# GENERAL

## INTRODUCTION

### SCOPE OF THIS MANUAL

This manual is intended for use by experienced technicians familiar with similar types of commercial grade communications equipment. It contains all required service information for the equipment and is current as of the publication date. Changes which may occur after publication are covered by either Service Bulletins or Manual Revisions. These are issued as required.

### ORDERING REPLACEMENT PARTS

When ordering replacement parts or equipment information, the full part identification number should be included. This applies to all parts : components, kits, or chassis. If the part number is not known, include the chassis or kit number of which it is a part, and a sufficient description of the required component for proper identification.

### PERSONAL SAFETY

The following precautions are recommended for personal safety:

- DO NOT transmit until all RF connectors are verified secure and any open connectors are properly terminated.
- SHUT OFF and DO NOT operate this equipment near electrical blasting caps or in an explosive atmosphere.
- This equipment should be serviced by a qualified technician only.

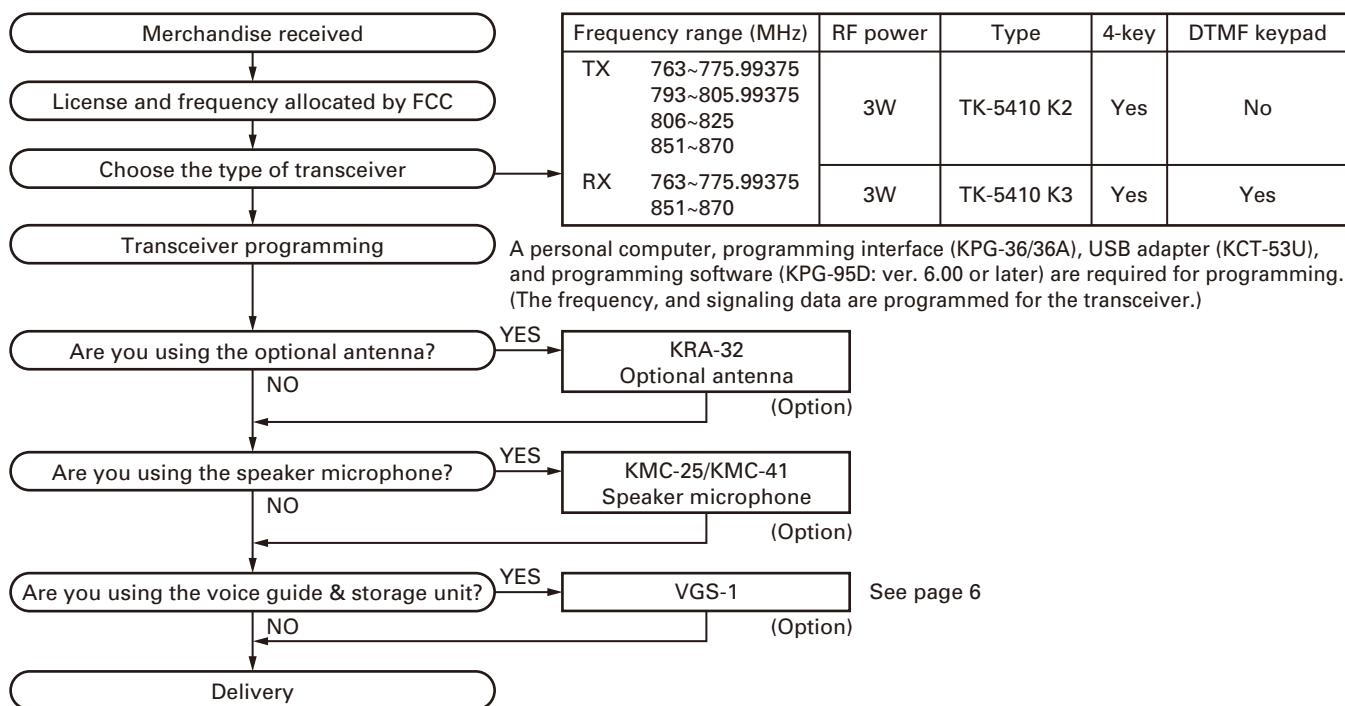

### SERVICE

This transceiver is designed for easy servicing. Refer to the schematic diagrams, printed circuit board views, and alignment procedures contained within.

### NOTE

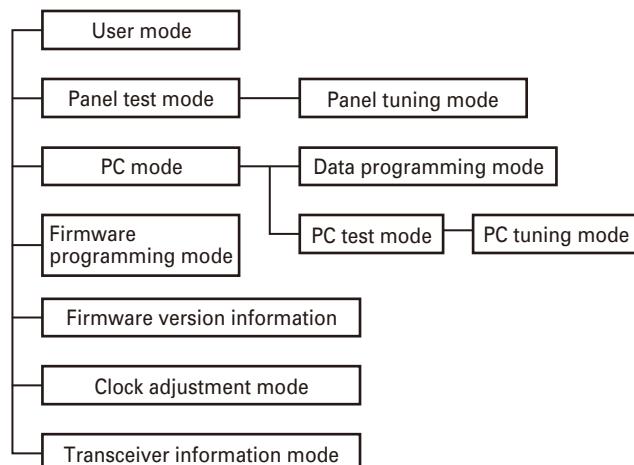

You must use KPG-95D version 6.00 or later for this transceiver. KPG-95D versions earlier than version 6.00 will not work properly.

# SYSTEM SET-UP

# REALIGNMENT

## 1. Modes

Mode	Function
User mode	For normal use.
Panel test mode	Used by the dealer to check the fundamental characteristics.
Panel tuning mode	Used by the dealer to tune the transceiver.
PC mode	Used for communication between the transceiver and PC.
Data programming mode	Used to read and write frequency data and other features to and from the transceiver.
PC test mode	Used to check the transceiver using the PC. This feature is included in the FPU.
Firmware programming mode	Used when changing the main program of the flash memory.
Firmware version information	Used to confirm the internal firmware version.
Clock adjustment mode	Used by the dealer to adjust date and time.
Transceiver information mode	Used to confirm the transceiver firmware version.

## REALIGNMENT

## 2. How to Enter Each Mode

Mode	Operation
User mode	Power ON
Panel test mode	Press and hold the [Side3] and [PTT] keys while turning the transceiver power ON and then release the [PTT] key first.
PC mode	Received commands from PC
Panel tuning mode	Press the [Side3] key, in Panel test mode
Firmware programming mode	Press and hold the [Side3] and [PTT] keys while turning the transceiver power ON and then release the [Side3] key first.
Firmware version information	Press and hold the [Side3] key while turning the transceiver power ON.
Clock adjustment mode	Press and hold the [Orange] and [PTT] keys while turning the transceiver power ON and then release the [Orange] key first.
Transceiver information mode	Press and hold the [Side1] and [PTT] keys while turning the transceiver power ON and then release the [PTT] key first.

## 3. Panel Test Mode

Setting method refer to ADJUSTMENT.

## 4. Panel Tuning Mode

Setting method refer to ADJUSTMENT.

## 5. PC Mode

## 5-1. Preface

The transceiver is programmed by using a personal computer, programming interface (KPG-36/36A), USB adapter (KCT-53U) and programming software (KPG-95D: ver. 6.00 or later).

The programming software can be used with a PC. Figure 1 shows the setup of a PC for programming.

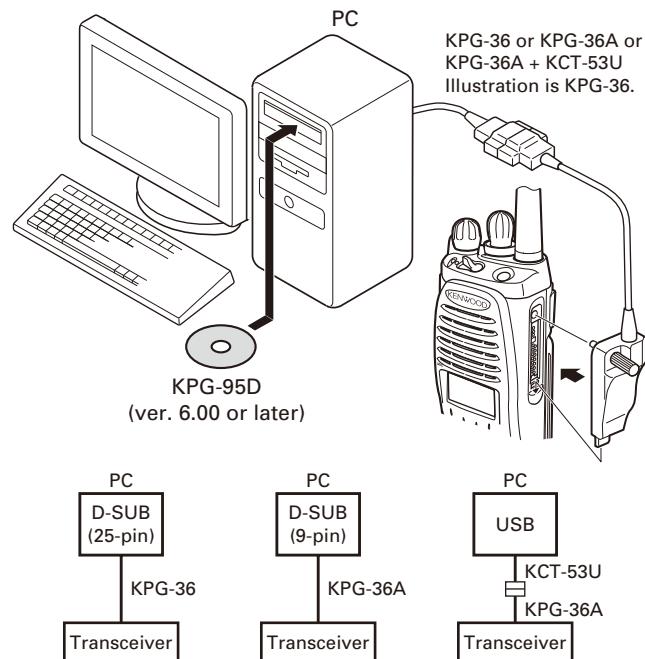

Fig. 1

## 5-2. Connection procedure

1. Connect the transceiver to the computer using the interface cable and USB adapter (When the interface cable is KPG-36A, the KCT-53U can be used.).

**Note:**

- You must install the KCT-53U driver in the computer to use the USB adapter (KCT-53U).
  - When using the USB adapter (KCT-53U) for the first time, plug the KCT-53U into a USB port on the computer with the computer power ON.
2. When the POWER switch on, user mode can be entered immediately. When PC sends command the transceiver enter PC mode, and "PROGRAM" is displayed on the LCD.  
When data is transmitting from the transceiver, the red LED lights.  
When data is receiving by the transceiver, the green LED lights.

**Note:**

The data stored in the computer must match the "Model Name and Market Code" when it is written into the EEPROM and flash memory.

# REALIGNMENT

## 5-3. KPG-36/KPG-36A description

### (PC programming interface cable: Option)

The KPG-36/36A is required to interface the transceiver to the computer. It has a circuit in its D-sub connector (KPG-36: 25-pin, KPG-36A: 9-pin) case that converts the RS-232C logic level to the TTL level.

The KPG-36/36A connects the universal connector of the transceiver to the RS-232C serial port of the computer.

## 5-4. KCT-53U description (USB adapter: Option)

The KCT-53U is a cable which connects the KPG-36A to a USB port on a computer.

When using the KCT-53U, install the supplied CD-ROM (with driver software) in the computer. The KCT-53U driver runs under Windows 2000, XP or Vista (32-bit).

## 5-5. Programming software KPG-95D description

The KPG-95D is the programming software for the transceiver supplied on a CD-ROM. This software runs under Windows 98, ME, Windows NT4.0, Windows 2000, XP or Vista (32-bit) on a PC.

The data can be input to or read from the transceiver and edited on the screen. The programmed or edited data can be printed out. It is also possible to tune the transceiver.

## 6. Firmware Programming Mode

### 6-1. Preface

Flash memory is mounted on the transceiver. This allows the transceiver to be upgraded when new features are released in the future. (For details on how to obtain the firmware, contact Customer Service.)

### 6-2. Connection procedure

Connect the transceiver to the personal computer using the interface cable (KPG-36/36A) and USB adapter (KCT-53U; when the interface cable is KPG-36A, the KCT-53U can be used.). (Connection is the same as in the PC Mode.)

### 6-3. Programming

1. Start up the firmware programming software (Fpro.exe (ver. 5.00 or later)). The Fpro.exe exists in the KPG-95D installed folder.
2. Set the communications speed (normally, 115200 bps) and communications port in the configuration item.
3. Set the firmware to be updated by File name item.
4. Press and hold the [Side3] and [PTT] keys while turning the transceiver power ON and then release the [Side3] key first. Then, the orange LED on the transceiver lights and the "PROGRAM FIRMWARE" is displayed.
5. Check the connection between the transceiver and the personal computer, and make sure that the transceiver is in the Program mode.
6. Press "write" button in the window. The orange LED turns off while the firmware is being erased. [PG] appears on the LCD and the green LED turns on when the firmware data is being received.
7. If writing ends successfully, the checksum is calculated and a result is displayed.

8. If you want to continue programming other transceivers, repeat steps 4 to 7.

### Note:

This mode cannot be entered if the Firmware Programming mode is set to Disable in the Programming software.

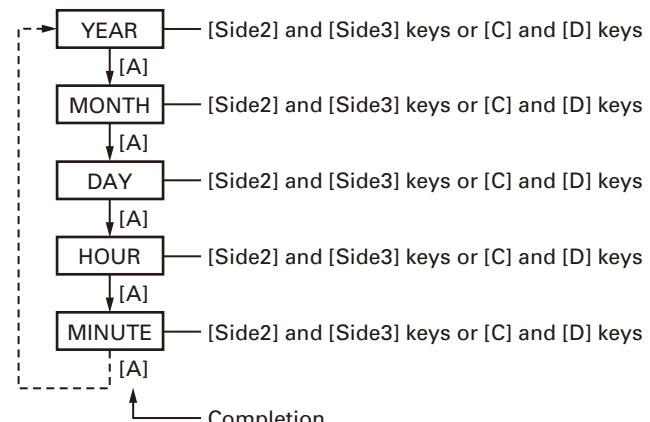

## 7. Firmware Version Information

Press and hold the [Side3] key while turning the transceiver power ON and then keep pressing and holding the [Side3] key, the firmware version information appears on the LCD.

## 8. Clock Adjustment Mode

### 8-1. Flow chart of operation

[Orange] + [PTT] + Power ON → Release [Orange]

## 9. Transceiver Information Mode

Use this function to confirm the transceiver firmware version.

1. Press and hold the [Side1] and [PTT] keys while turning the transceiver power ON and then release the [PTT] key first.
2. The transceiver firmware version appears on the LCD.
3. To exit the transceiver information mode, turn the transceiver power OFF.

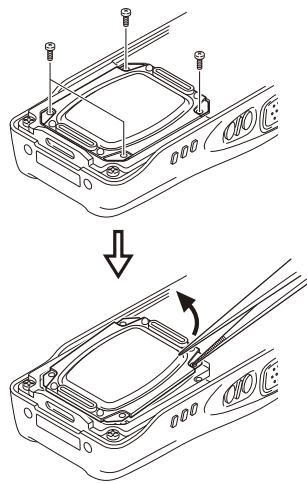

# TK-5410

## INSTALLATION

### Voice Guide & Storage Unit (VGS-1: Option)

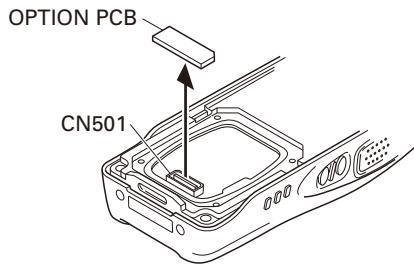

#### ■ Installing the VGS-1 unit in the transceiver

1. Remove the 4 screws from the cover.
2. Remove the cover by inserting the tip of a pair of tweezers into the screw hole of the cover and prying it open.

**Fig. 1**

3. Remove the OPTION PCB from the connector (CN501) of the TX-RX PCB.

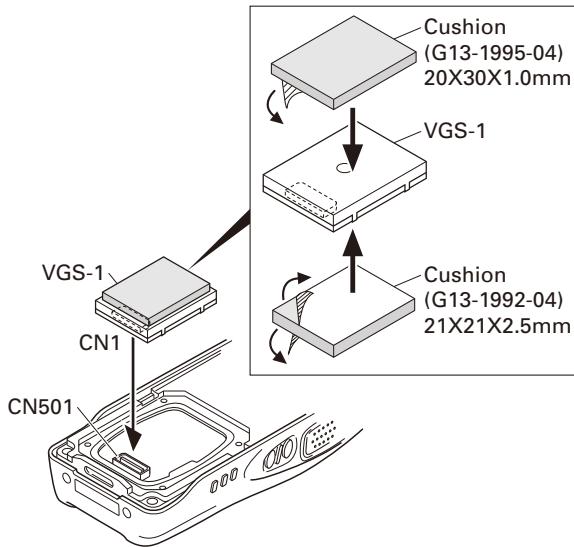

**Fig. 2**

4. Attach two cushions to the VGS-1 as shown in the figure 3.

#### Note:

Be sure not to cover the VGS-1 connector (CN1) with the cushion.

5. Insert the VGS-1 connector (CN1) into the connector (CN501) of the TX-RX PCB.

**Fig. 3**

6. Reinstall the cover using the 4 screws removed in step 1.

#### Note:

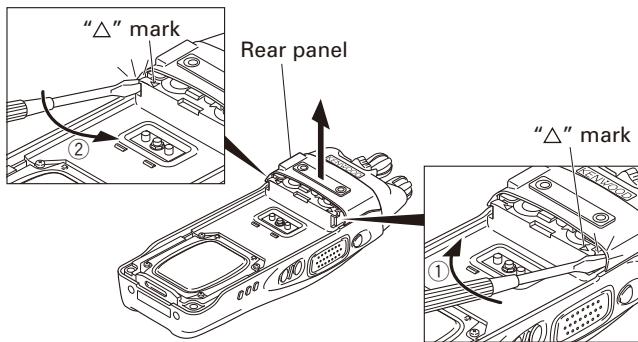

You must setup using the KPG-95D.

# DISASSEMBLY FOR REPAIR

## Disassembly Procedure

### ■ Removing the front case from the chassis

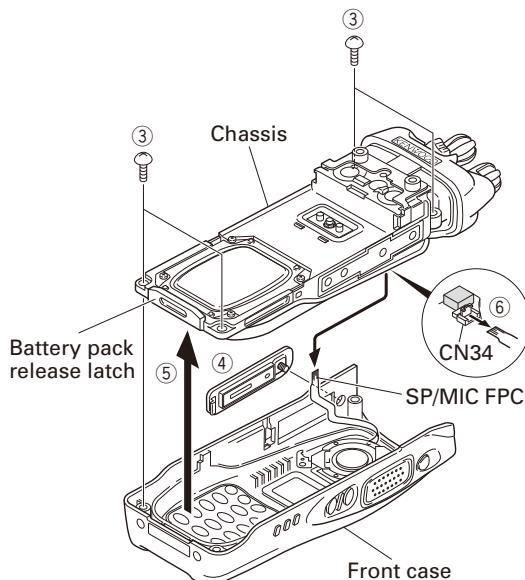

1. Remove the rear panel with a flat-head screwdriver. Insert the screwdriver between the rear panel (right side) and the chassis (the place next to the "△" mark shown on the chassis), push it in the direction of the arrow ①, and remove the right side of the rear panel. Repeat the above action for the left side of the rear panel ②.

2. Remove the four screws ③ and universal connector cap ④.
3. Lift the battery pack release latch on the bottom of the chassis ⑤ and remove the chassis from the front case.

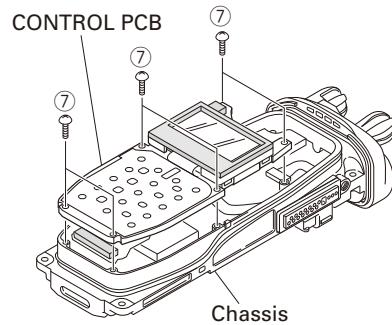

#### Note:

- Lift the chassis from the front case slowly and carefully. If the chassis is lifted suddenly, the SP/MIC FPC may be pulled and the connector may become damaged.
  - Handle the main packing with care. It is likely to collect dust and dirt.
4. Remove the SP/MIC FPC from the CONTROL PCB connector (CN34) ⑥.

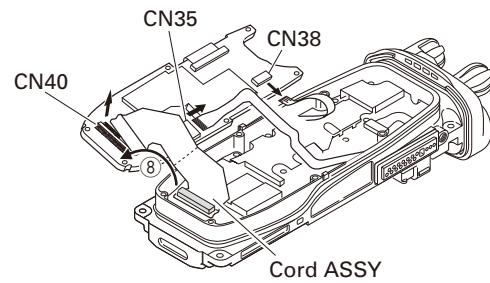

### ■ Removing the CONTROL PCB (X53-439) from the chassis

1. Remove the six screws ⑦.

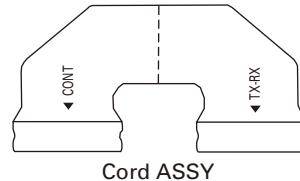

2. On the reverse side of the CONTROL PCB ⑧, remove the cord ASSY and each FPC from the connectors (CN40, CN35, CN38) of the CONTROL PCB.

#### Note:

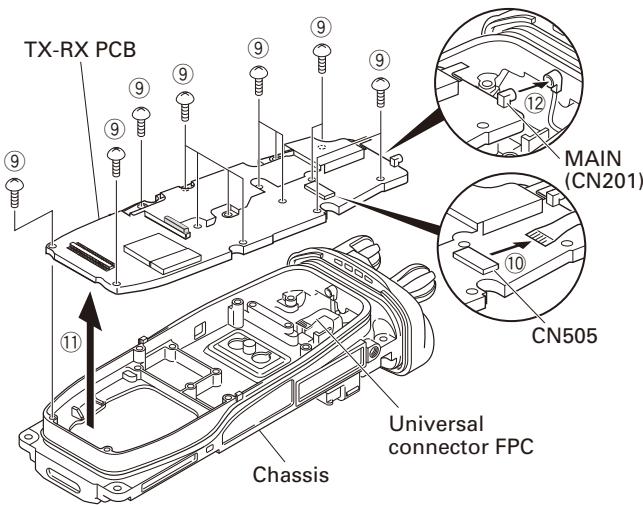

- Fold indications are printed on the Cord ASSY and Universal Connector FPC.  
"----" line shows creased line on the bottom.

## DISASSEMBLY FOR REPAIR

**■ Removing the TX-RX PCB (X57-756 A/3) from the chassis**

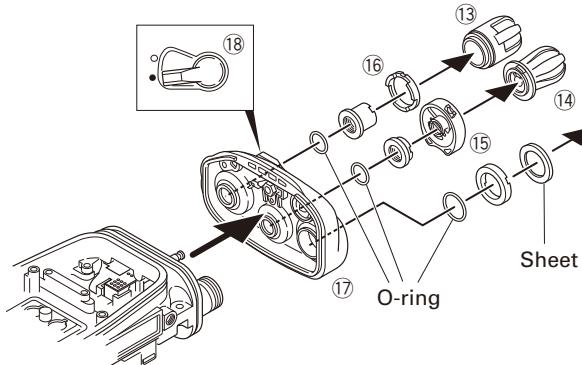

1. Remove the 14 screws ⑨.
2. Remove the universal connector FPC from the TX-RX PCB connector (CN505) ⑩.
3. Insert the two tips of a pair of tweezers into the two holes in the bottom of the shield plate of the TX-RX PCB, firmly squeeze the tweezers to hold the shield plate, then remove the TX-RX PCB ⑪.
4. Remove the coaxial cables from the connector (MAIN (CN201)) of the TX-RX PCB ⑫.

**■ Removing the top panel from the chassis**

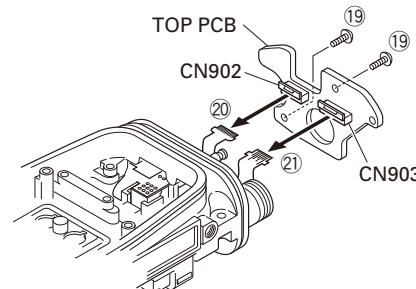

1. Remove the volume knob ⑬ and channel knob ⑭.
2. Remove the concentric switch knob ⑮.
3. Remove the volume torque-up packing ⑯ using a pair of tweezers.
4. Remove the nuts from the volume knob, channel knob and antenna receptacle.
5. Remove the top panel ⑰.

**Note:**

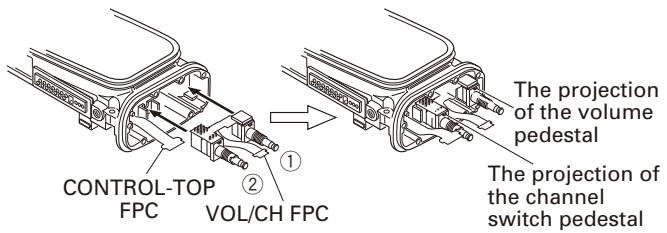

- Before removing the top panel, set the lever switch to the “●” position (circle painted in white) ⑯.
- Each of the volume knob, channel knob and antenna receptacle on the top panel has an O-ring. Take care not to lose them after removing the panel.

**■ Removing the TOP PCB (X57-756 B/3) from the chassis**

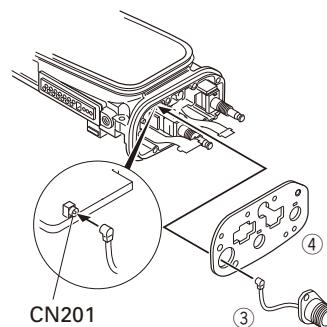

1. Remove the two screws ⑯.
2. Lift the TOP PCB and remove the VOL/CH FPC ⑳ and CONTROL-TOP FPC ㉑ from the two connectors (CN902, CN903) of the TOP PCB.

**Precautions for Reassembly****■ Installing the VOL/CH FPC and CONTROL-TOP FPC on the TOP PCB**

1. Remove the volume ① and channel switch ② from the chassis.
2. Position the coaxial cable connecting the ANT PCB and TX-RX PCB as shown in the figure below.

3. Pass the coaxial cable ③ of the antenna receptacle through the round hole of the hardware fixture ④, then insert it into the coaxial connector (MAIN (CN201)) of the TX-RX PCB.

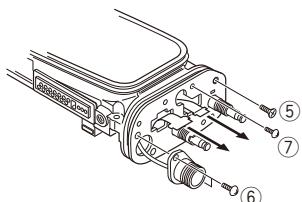

# DISASSEMBLY FOR REPAIR

4. Pass the volume, channel switch, VOL/CH FPC and CONTROL-TOP FPC through hardware fixture holes, then bring the hardware fixture into contact with the chassis and fix it with a screw ⑤.

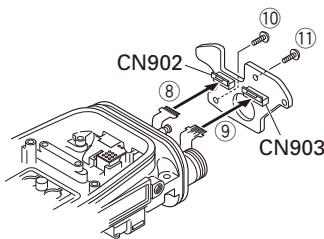

**Note:**

The projections of the volume and channel switch pedestals must protrude from the square holes of the hardware fixture.

5. Fix the antenna receptacle with the two screws ⑥.
6. Fix the hardware fixture with a screw ⑦.

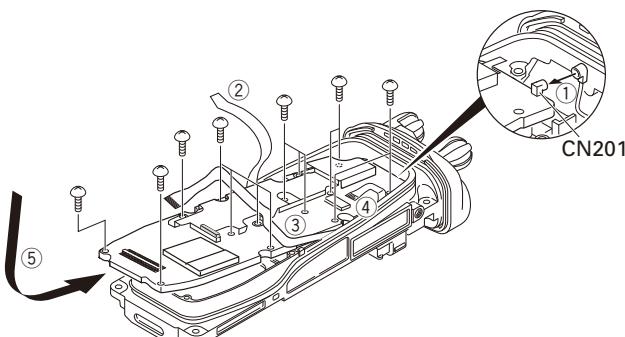

7. Insert the VOL/CH FPC ⑧ and the CONTROL-TOP FPC ⑨. into the connectors (CN902, CN903) of the TOP PCB.
8. Fix the TOP PCB with a screw ⑩.
9. Fix the TOP PCB with a screw ⑪.

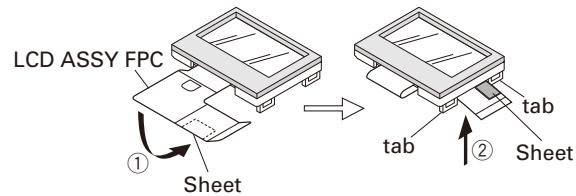

**■ TX-RX PCB Installation Procedure**

1. Insert the coaxial cable of the antenna receptacle into the coaxial connector (CN201) of the TX-RX PCB ①.
2. Grasp both sides of the lower part of the TX-RX PCB, tilt the TX-RX PCB and install the chassis so that the PTT FPC ②, CONTROL-TOP FPC ③ and universal connector FPC ④ are not caught ⑤.
3. Fix the TX-RX PCB with the 14 screws.

**■ LCD ASSY Installation Procedure**

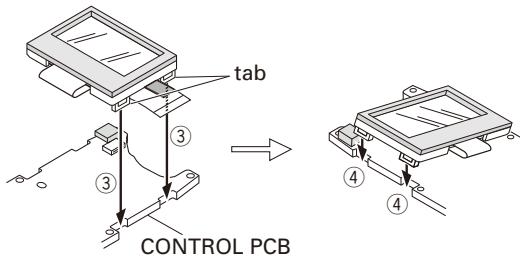

1. Fold the LCD ASSY FPC to the back of the holder ① so that the FPC is between the two tabs on the right side of the holder ②.

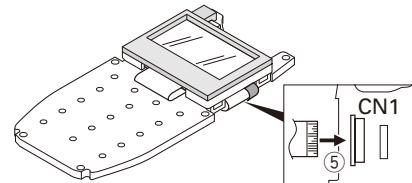

2. Fit the two tabs on the right side of the holder ③ and the two tabs on the left side of the holder ④ into the CONTROL PCB.

**Note:**

Take care that the FPC is not caught when fitting the two tabs on the right side of the holder.

3. Insert the FPC into the CONTROL PCB connector (CN1) ⑤.

## DISASSEMBLY FOR REPAIR

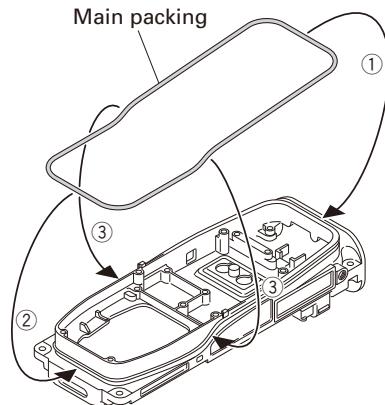

**■ Main Packing (G53-1637-04) Installation Procedure**

1. Hook the packing (coated with silicon oil) in the upper groove of the chassis ①, then fit the packing into the lower groove of the chassis ②.

**Note:**

Ensure that the chassis grooves and packing are free from dirt and dust.

2. Fit the packing into the grooves on both sides of the chassis ③. (Fit the packing into the groove in the chassis by tracing it lightly with your fingers.)

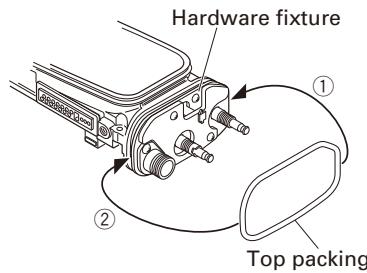

**Note:**

To remove the packing from the chassis groove, use a resin adjustment bar or other such device. If the packing is pried with a sharp metallic tool, such as tweezers, the packing may become damaged.

3. Verify that the packing fits snugly into the groove of the chassis.

**■ Top Packing (G53-1638-04) Installation Procedure**

1. Ensure that the hardware fixture is first secured to the chassis.
2. Hook the packing (coated with silicon oil) in the upper left groove of the chassis ①, then fit the packing into the right groove of the chassis ②.

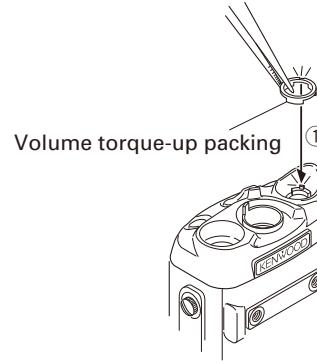

**Note:**

- Verify that the chassis grooves and packing are free from dirt and dust.
- To remove the packing from the chassis groove, use a resin adjustment bar or other such device. If the packing is pried with a sharp metallic tool, such as tweezers, the packing may become damaged.

3. Verify that the packing fits snugly into the groove of the chassis.

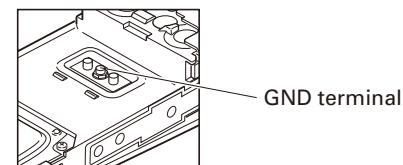

**■ Volume Torque-up Packing (G53-1628-04) Installation Procedure**

Insert the packing using a pair of tweezers so that the hollow of the packing fits the convex of the panel ①.

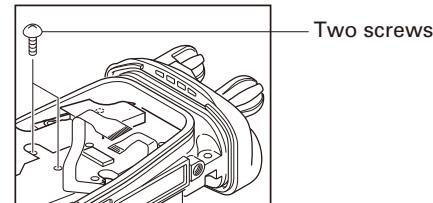

**■ Screw sequence for mounting the battery terminal block to the chassis**

Attach the battery terminal block to the chassis as described in the following procedure.

1. Loosely fix the hexagon screws of the GND terminal to the chassis (enough so that the hexagon screws do not move).

2. Tighten the two screws from the TX-RX PCB side.

3. Firmly tighten the hexagon screws of the GND terminal.

# DISASSEMBLY FOR REPAIR

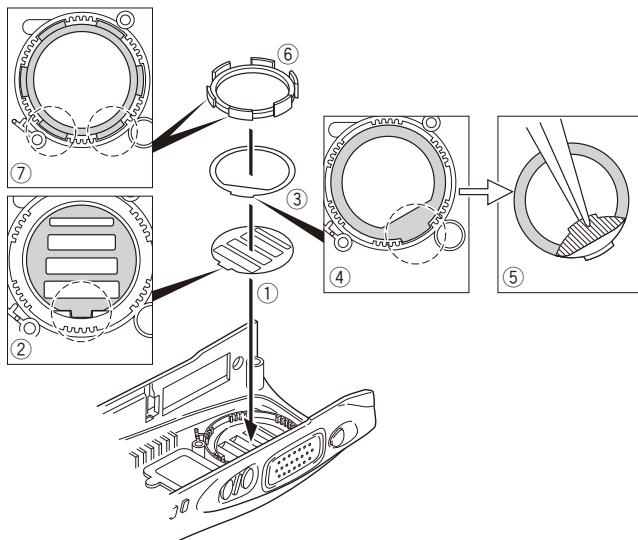

## Installation Procedure During Parts Replacement

### ■ Attaching the Sheet (G10-1338-04, J99-0383-14) to the Front Case Speaker and Installation of the Packing (G53-1633-04)

1. Attach a new fiber sheet ① (G10-1338-04) so that its convex fits the hollow of the front case ②.
2. Attach a new pressure sensitive adhesive sheet ③ (J99-0383-14) so that its convex fits the hollow of the front case ④.
3. Remove the separation sheet from the pressure sensitive adhesive sheet with a pair of tweezers ⑤.
4. Fit the packing ⑥ (G53-1633-04) into the front case speaker.

#### Note:

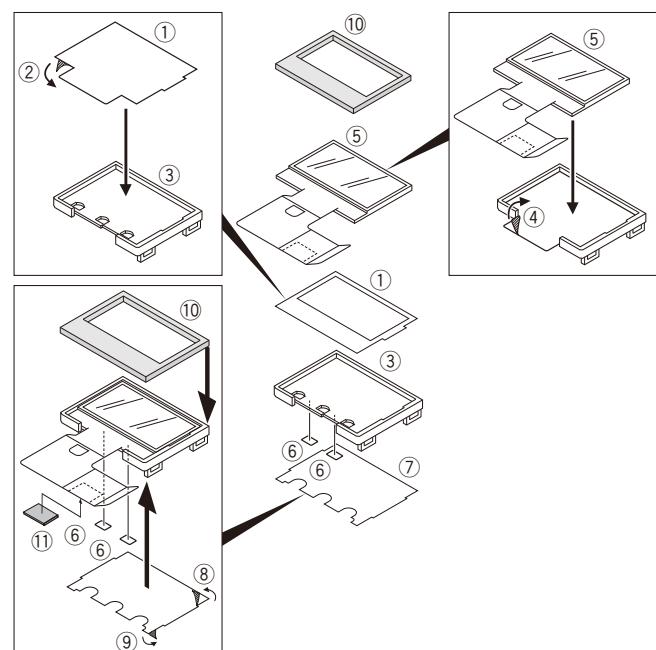

Fit the packing into the hollow of the case so that the two low-height places in the convex of the packing are positioned on the lower side ⑦.

5. Verify that the packing does not ride on the rib of the case.

### ■ Installing a new LCD ASSY to the holder

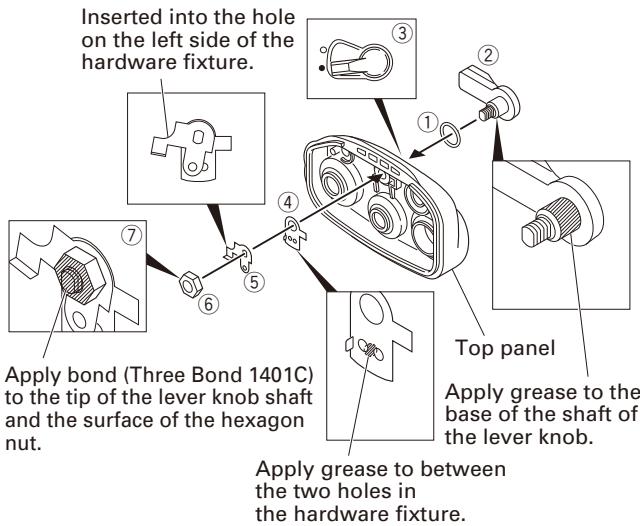

1. Remove the separation paper (brown) from the new sheet ① ②, and attach the sheet to the surface of the holder ③.
2. Remove the protection sheets attached to both sides of the new LCD ASSY.
3. Remove the separation paper (white) from the sheet in step 1 ④, then attach the LCD ASSY ⑤ to the sheet.
4. Attach two pieces of double-sided adhesive tape ⑥ to the back of the holder and remove the separation paper.
5. Remove the protection sheet (transparent) attached to one side of the new filter ⑦ ⑧ and remove the protection sheet (yellow) from the other side ⑨.
6. Attach the filter from step 5 to the back of the holder.
7. Attach the new cushion ⑩ so that it fits to the corner of the holder convex.

## DISASSEMBLY FOR REPAIR

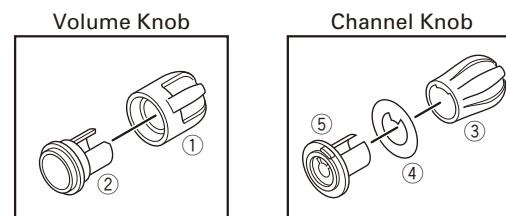

**■ Procedures when Replacing the Top Panel**

1. Insert the O-ring ① into the lever switch part of the new top panel.
2. Apply grease to the base of the shaft of the lever knob ② and install the lever knob so that it is in the “●” position (circle painted in white) on the top panel ③.
3. Pass the hardware fixture ④ through the shaft and install it onto the top panel.
4. Apply grease to between the two holes in the hardware fixture ④.
5. Install the hardware fixture ⑤ so that it is inserted into the hole on the left side of the hardware fixture ④.
6. Fix the two hardware fixtures with the hexagon nut ⑥.
7. Apply bond (Three Bond 1401C) to the tip of the lever knob shaft and the surface of the hexagon nut ⑦.

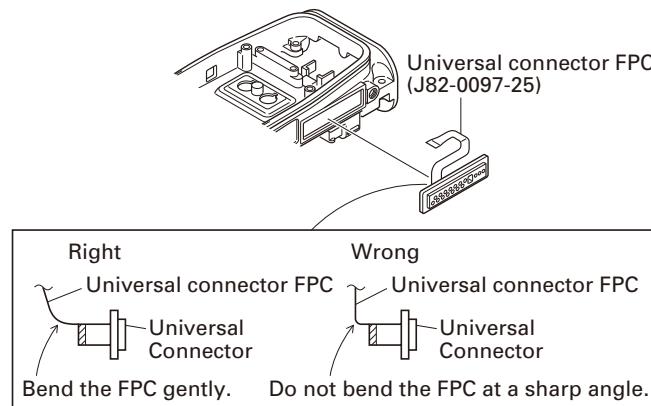

**■ Volume Knob and Channel Knob Parts****Replacement**

Since the volume knob consists of two components, a knob ① and a spacer ②, replace and reinstall these two parts at the same time.

Since the channel knob consists of three components, a knob ③, a 16CH display seal ④ and a spacer ⑤, replace and reinstall these three parts at the same time.

**■ Procedure when replacing the universal connector FPC (J82-0097-25)**

When assembling a new universal connector FPC, insert the FPC into the chassis hole by gently bending the FPC as shown in the figure.

# CIRCUIT DESCRIPTION

## 1. Overview

The KENWOOD model TK-5410 is a 700M/800MHz FM & P25 Portable transceiver designed to operate in the frequency range of 763 to 775.99375MHz, 793 to 805.99375MHz (700M) and 806 to 825MHz, 851 to 870MHz (800M).

The unit consists of a receiver, a transmitter, a phase-locked loop (PLL) frequency synthesizer, a digital control unit, and a power supply circuit.

## 2. Frequency Configuration

The receiver is a double-conversion super heterodyne using a first intermediate frequency (IF) of 58.05MHz and a second IF of 450kHz. Incoming signals from the antenna are mixed with the local signal from the PLL circuit to produce the first IF of 58.05MHz.

This is then mixed with the 57.6MHz second local signal to produce the 450kHz second IF. This signal is detected to give the demodulated signal in the DSP.

The transmit signal frequency is generated by the PLL VCO, and modulated by the signal from the DSP. It is then amplified and fed to the antenna.

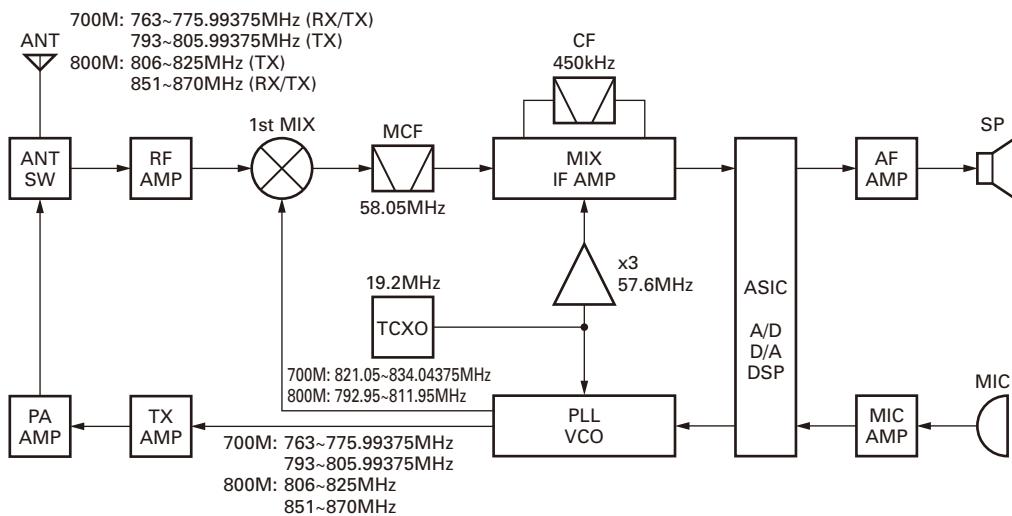

Fig. 1 Frequency configuration

## 3. Receiver System

### 3-1. Front-end RF Amplifier

The receive signal from antenna SW (D202, D203, D303, D304) is amplified by a RF amplifier (700MHz band: Q305, 800MHz band: Q302) and passes through the band-pass filter (700MHz band: L301, L303, 800MHz band: L300, L302) to remove unwanted signals. These are controlled with the RF filter switch (IC309 and IC310). The signal is then fed to the 1st mixer.

### 3-2. 1st Mixer

The 1st mixer uses a silicon monolithic mixer (IC300). The 1st mixer mixes the signal with the 1st local oscillator frequency from the VCO, and converts it to the 1st IF (58.05MHz) (700M/Upper heterodyne, 800M/Lower heterodyne).

The signal then passes through the monolithic crystal filter (XF300) to remove unnecessary nearby frequency components. The signal from the MCF is used as the 1st IF signal.

### 3-3. IF Amplifier

The 1st IF signal is amplified by the IF amplifier (Q309) and fed into the FM IC (IC304). The IF signal is then mixed with the 2nd local oscillator frequency of 57.6MHz to generate the 2nd IF of 450kHz. The 450kHz signal is then passed through a ceramic filter (CF300) and fed back into IC304 for additional amplification.

### 3-4. Wide/Narrow/P25 Switching Circuit

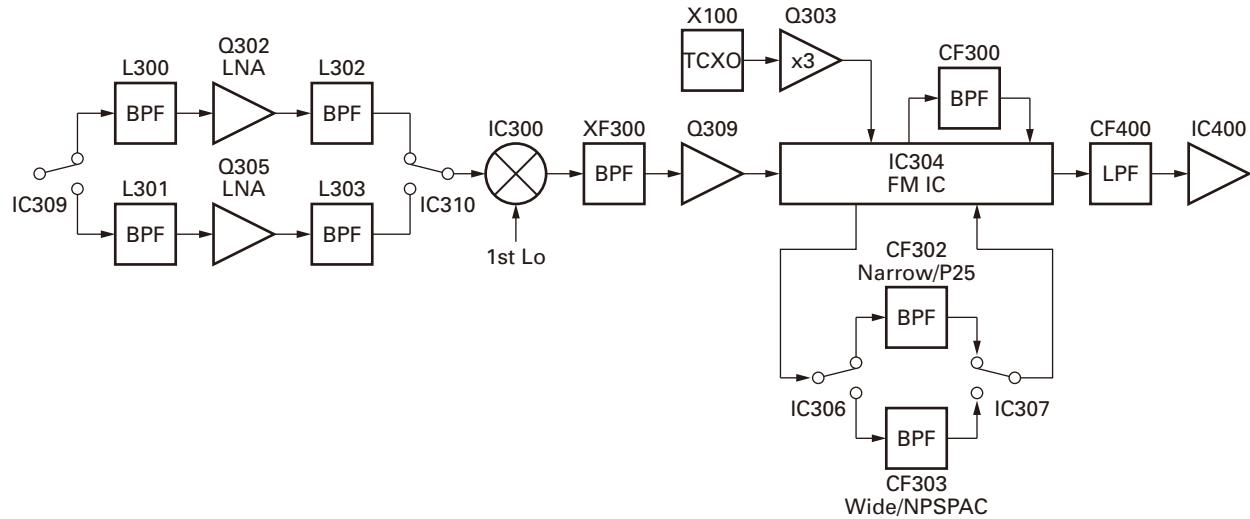

Wide, Narrow, NPSPAC and P25 settings can be made for each channel by switching the ceramic filters CF303 (Wide, NPSPAC), and CF302 (Narrow, P25). These are controlled with multiplexers (IC306, IC307).

When a W/N signal line is H, the 450kHz signal is passed through a ceramic filter (CF303).

When a W/N signal line is L, the 450kHz signal is passed through a ceramic filter (CF302).

The signal is then fed into ASIC (IC10) through ceramic filter (CF400). The signal is then demodulated in ASIC, and the AF signal is dealt with DSP (IC3).

## CIRCUIT DESCRIPTION

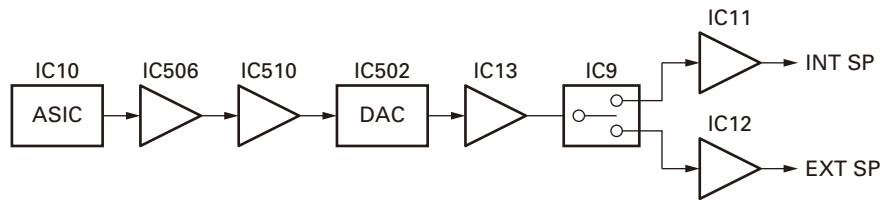

**Fig. 2 RF and IF circuit**

### 3-5. Audio Amplifier Circuit

The AF signal from ASIC (IC10) is filtered for anti-aliasing and to eliminate unwanted spectrums. Next, the AF signal goes through an electronic volume control (IC10) to adjust its level and a buffering AF amplifier IC506. Finally the AF signal into the audio power amplifier (IC11, IC12).

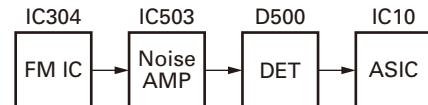

The audio output can be provided to an external speaker (CN505 12-pin, 13-pin) or internal speaker (CN34 1-pin, 2-pin, 3-pin, 4-pin). When the INAMT signal is H, AF signal loads CN34. When the EXAMT signal is H, AF signal loads CN505.

**Fig. 3 Audio amplifier circuit**

### 3-6. Squelch Circuit

It amplifies the demodulated noise signal from FM IC (IC304) after filtering through the BPF circuit. Then amplified signal is the converted to a DC signal by the detection circuit. The converted signal is fed to the ASIC (IC10).

**Fig. 4 Squelch circuit**

# CIRCUIT DESCRIPTION

## 4. Transmitter System

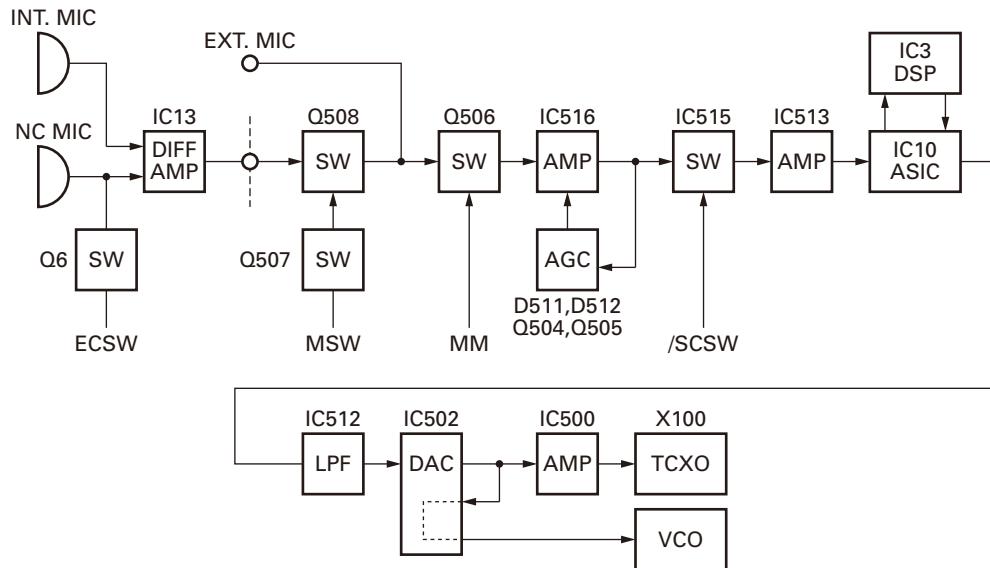

### 4-1. Audio Band Circuit

The signal from the microphone passes through the mute switch (Q506), summing amplifier (IC516), and AGC circuit (IC516, D511, D512, Q504, Q505), and goes to the microphone amplifier (IC513). It is then fed into ASIC (IC10) and converted from analog to digital. The digitalized signal undergoes AGC processing, pre-emphasizing, filtering, vocoding (in P25 mode), and returns to the ASIC (IC10). The signal is converted from digital to analog and is amplified by ASIC (IC10). Then the signal is adjusted to the appropriate level and is passed through the amplifier (IC512), and then to the VCO and TCXO in the PLL section.

### 4-2. Base Band Circuit

The audio signal output from the base band circuit is converted to digital data with a sampling frequency of 48kHz. This digital data is sent to the DSP (IC3), and voice signals of 300Hz or lower and frequencies of 3kHz or higher are cut off so that the audio range of 300Hz to 3kHz is extracted. The audio signal is then pre-emphasized in FM mode and synthesized with signals, such as QT and DQT, as required, and is then output from the ASIC (IC10). In Digital mode, the audio signal is converted to the C4FM base band signal and output from IC10. The DTMF and MSK base band signals are also generated by the DSP and output via IC10.

LPF (IC512) works as a smoothing filter. The DAC (IC502) assigns the base band signal to the VCO and TCXO (X100). At this time, the level output according to the transmit carrier is fine-adjusted according to each modulation method.

**Fig. 5 Audio band and Base band circuit**

## CIRCUIT DESCRIPTION

### 4-3. Drive and Final amplifier

The transmit signal passing through the T/R switch (D200) is amplified to approx. 50mW by the two transistor amplification circuits (Q200, Q201). The transmit signal output from Q201 passes through an attenuator to improve high-frequency signal matching, and is amplified by the drive amplifier (Q202). The signal is then applied to the final amplifier (Q204) so that the antenna output is 3W (1W for Low Power).

The output of the final amplifier (Q204) is then passed through the antenna switch (D202, D203), spurious removing LPF (L212) and surge protection HPF. It is then applied to the antenna terminal (CN201).

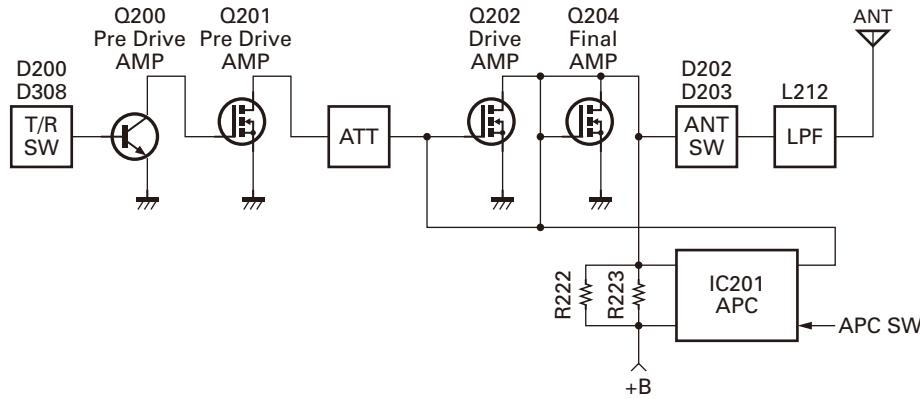

### 4-4. APC circuit

The APC circuit detects the current of the drive amplifier (Q202) and final amplifier (Q204) during transmission

and controls the output power by controlling the current. It detects the current using R222 and R223 and applies a drop voltage between both resistors during transmission to APC IC (IC201). It controls the transmission current of the drive amplifier and final amplifier so that it is constant by comparing this current with the reference voltage output from pin 7 of IC200. The reference voltage input to pin 6 of IC200 is output from the DAC (IC502). High/Low power output is set according to the DAC output voltage.

### 4-5. Temperature Protection Circuit

The temperature protection circuit reduces the APC voltage when the temperature of Q204 rises, to prevent thermal destruction of the final amplifier (Q204). The ASIC (IC10) detects the temperature with a thermistor (TH200) to control the reference voltage to the APC circuit.

**Fig. 6 Drive and final amplifier and APC circuit**

## 5. PLL Frequency Synthesizer

### 5-1. TCXO (X100)

TCXO (X100) generates a reference frequency of 19.2MHz for the PLL frequency synthesizer. This reference frequency is applied to pin 8 of the PLL IC (IC101).

The TCXO oscillation frequency is fine-adjusted by controlling the voltage applied to pin 1 of the TCXO with DAC (IC502). It is also controlled with pin 1 of the TCXO if the output from the TCXO is modulated.

### 5-2. VCO

There are two VCOs (VCO1, VCO2). VCO1 (Q106) generate the 1st local receive signal for the 800MHz band (396.475 to 405.975MHz) and transmits a carrier for the 700MHz band (381.5 to 403.0MHz). VCO2 (Q107) generates the 1st local receive signal for the 700MHz band (410.525 to

417.025MHz) and transmits a carrier for the 800MHz band (403.0 to 435.0MHz).

The VCO oscillation frequency is determined by one system of operation switching terminal "VCOSW1" and two systems of voltage control terminals "CV" and "ASSIST". The operation switching terminal, "VCOSW1", is controlled by the ASIC (IC10). When the VCOSW1 logic is high, the VCO1 outputs the signal, and if the logic is low, VCO2 outputs the signal.

The voltage control terminals, "CV" and "assist", are controlled by the PLL IC (IC101) and ASIC (IC10) and the output frequency changes continuously according to the applied voltage. For the modulation input terminal, "VCO\_MOD", the output frequency changes according to the applied voltage. This is used to modulate the VCO output. "VCO\_MOD" works only when transmitting (user pressed PTT).

# CIRCUIT DESCRIPTION

## 5-3. Doubler (Q111)

The doubler (Q111) extracts the double harmonic component from the signal output from the VCO. This double harmonic component is then fed into pin 5 of the PLL IC.

## 5-4. PLL IC (IC101)

The PLL IC compares the differences in phases of the VCO oscillation frequency and the TCXO reference frequency, returns the difference to the VCO CV terminal and realizes the "Phase Locked Loop" for the return control. This allows the VCO oscillation frequency to accurately match (lock) the desired frequency.

When the frequency is controlled by the PLL, the frequency convergence time increases as the frequency difference increases when the set frequency is changed. To supplement this, the ASIC (IC10) is used before it is controlled by the PLL IC to bring the VCO oscillation frequency close

to the desired frequency. As a result, the VCO CV voltage does not change and is always stable at approx. 2.5V.

The desired frequency is set for the PLL IC by the ASIC through the 3-line "PCS\_RF", "SDO0", "SCK0" serial bus. Whether the PLL IC is locked or not is monitored by the ASIC through the "PLD" signal line. If the VCO is not the desired frequency (unlock), the "PLD" logic is low.

## 5-5. Local Switch (D200, D308)

The connection destination of the signal output from the VCO is changed with the diode switch (D200) that is controlled by the transmission power supply, 5T, and the diode switch (D308) that is controlled by the receiver power supply, 5R.

If the 5T logic is high, it is connected to a transmit-side pre-drive (Q200). If the 5T logic is low, it is connected to a receiver-side mixer (IC300).

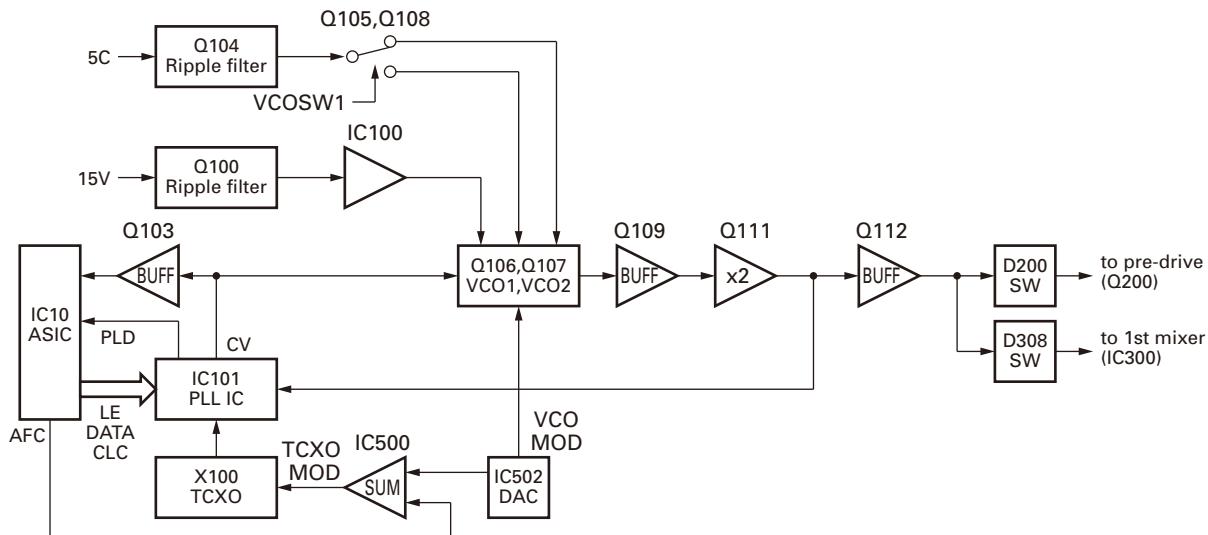

Fig. 7 PLL block diagram

## 6. Control Circuit

The control circuit consists of the ASIC (IC10) and its peripheral circuits. IC10 mainly performs the following;

- 1) Switching between transmission and reception by PTT signal input.
- 2) Reading system, zone, frequency, and program data from the memory circuit.
- 3) Sending frequency program data to the PLL.
- 4) Controlling squelch on/off by the DC voltage from the squelch circuit.
- 5) Controlling the audio mute circuit by decode data input.

### 6-1. ASIC

The ASIC (IC10) is 32bit RISC processor, equipped with peripheral function and ADC/DAC.

This ASIC operates at a 18.432MHz clock and 3.3V/1.5V DC. It controls the flash memory, SRAM, DSP, receiver circuit, transmitter circuit, control circuit, and display circuit and transfers data to or from an external device.

# CIRCUIT DESCRIPTION

## 6-2. Memory Circuit

The memory circuit consists of the ASIC (IC10), the SRAM (IC4), and the flash memory (IC1). The flash memory has capacity of 32M-bit that contains the transceiver control program for the ASIC and stores the data. It also stores the data for transceiver channels and operating parameters that are written by the FPU. This program can be easily written from external devices. The SRAM has a capacity of 1M-bit that contains work area and data area.

### ■ Flash memory

**Note:** The flash memory stores the data that is written by the FPU (KPG-95D), tuning data (Deviation, Squelch, etc.), and firmware program (User mode, Test mode, Tuning mode, etc.). This data must be rewritten when replacing the flash memory.

### ■ SRAM (static memory)

**Note:** The SRAM has a temporary data area and work area. When the power supply is off, it is backed up via an internal secondary lithium battery. Therefore, the saved data is not lost.

### ■ Real-time clock

The clock function is based on a real-time clock IC (IC7). When the power supply is off, it is backed up by an internal secondary lithium battery

### 6-3. LCD

The LCD is controlled using the bus lines on the connector (CN1) of the control unit. The LCD contrast voltage is corrected using IC712.

### 6-4. Temperature Detection Circuit

The temperature detection circuit detects the temperature using a temperature IC (IC714) and corrects the thermal characteristic change of the squelch or LCD.

### 6-5. Key Detection Circuit

Keys are detected using a Key scan circuit in IC10. The KEY1\* signals that are normally pulled down go high when any key is pressed.

### 6-6. Low Battery Warning

The battery voltage is divided using R713 and R714 and is detected by the ASIC (IC10). When the battery voltage falls below the voltage set by the Low battery warning adjustment, the red LED blinks to notify the operator that it is time to replace the battery. If the battery voltage falls even more (approx. 5.8V), a beep sounds and transmission stops.

Low battery warning	Battery condition
The red LED blinks during transmission.	The battery voltage is low but the transceiver is still usable.
The red LED blinks and the warning tone while the PTT switch is pressed.	The battery voltage is low and the transceiver is not usable to make calls.

## 6-7. Battery Type Detection

The transceiver automatically detects the battery type, measuring the resistance between the S-terminal and GND terminal on the battery pack and changes the supplied voltage to the S-terminal as below. The microprocessor then detects the battery type.

Battery type	Input voltage of S-terminal	Resistor value
Battery case	0~0.2V	Short
Li-ion battery	1.00~1.11	47kΩ
Ni-Cd battery	3.23~3.37	Open
Ni-MH battery	1.90~2.06	150kΩ

## 6-8. VOX

The VOX function can be used only with an external microphone.

The VOX (Voice Operated Transmission) function detects voice input to the microphone and automatically switches between transmission and reception.

If the microphone input exceeds a certain level, transmission automatically begins. If the input falls below a certain level, the transceiver automatically returns to receive mode.

The transceiver realizes this function using DSP (IC8).

## 6-9. DSP

The DSP circuit consists of a DSP (IC3) and processes the base band signal. The DSP operates on an external clock of 18.432MHz (the same as the IC10). The I/O section operates at 3.3V and the core section operates at 1.5V. The DSP carries out the following processes:

- C4FM, CQPSK processing
- Analog FM pre-emphasis/de-emphasis
- Vocoder processing between audio codec and modulation/demodulation
- CAI processing, such as error correction encoding
- QT/DQT encoding/decoding
- DTMF encoding
- Compressor/expander processing
- Voice scrambler processing
- Transmit/receive audio filtering processing
- Microphone amplifier AGC processing
- Audio mute processing
- Modulation level processing

# CIRCUIT DESCRIPTION

## 7. Power Supply Circuit

The power supply voltage (+B) is supplied from the battery terminal, and is then passed through the fuse (F700).

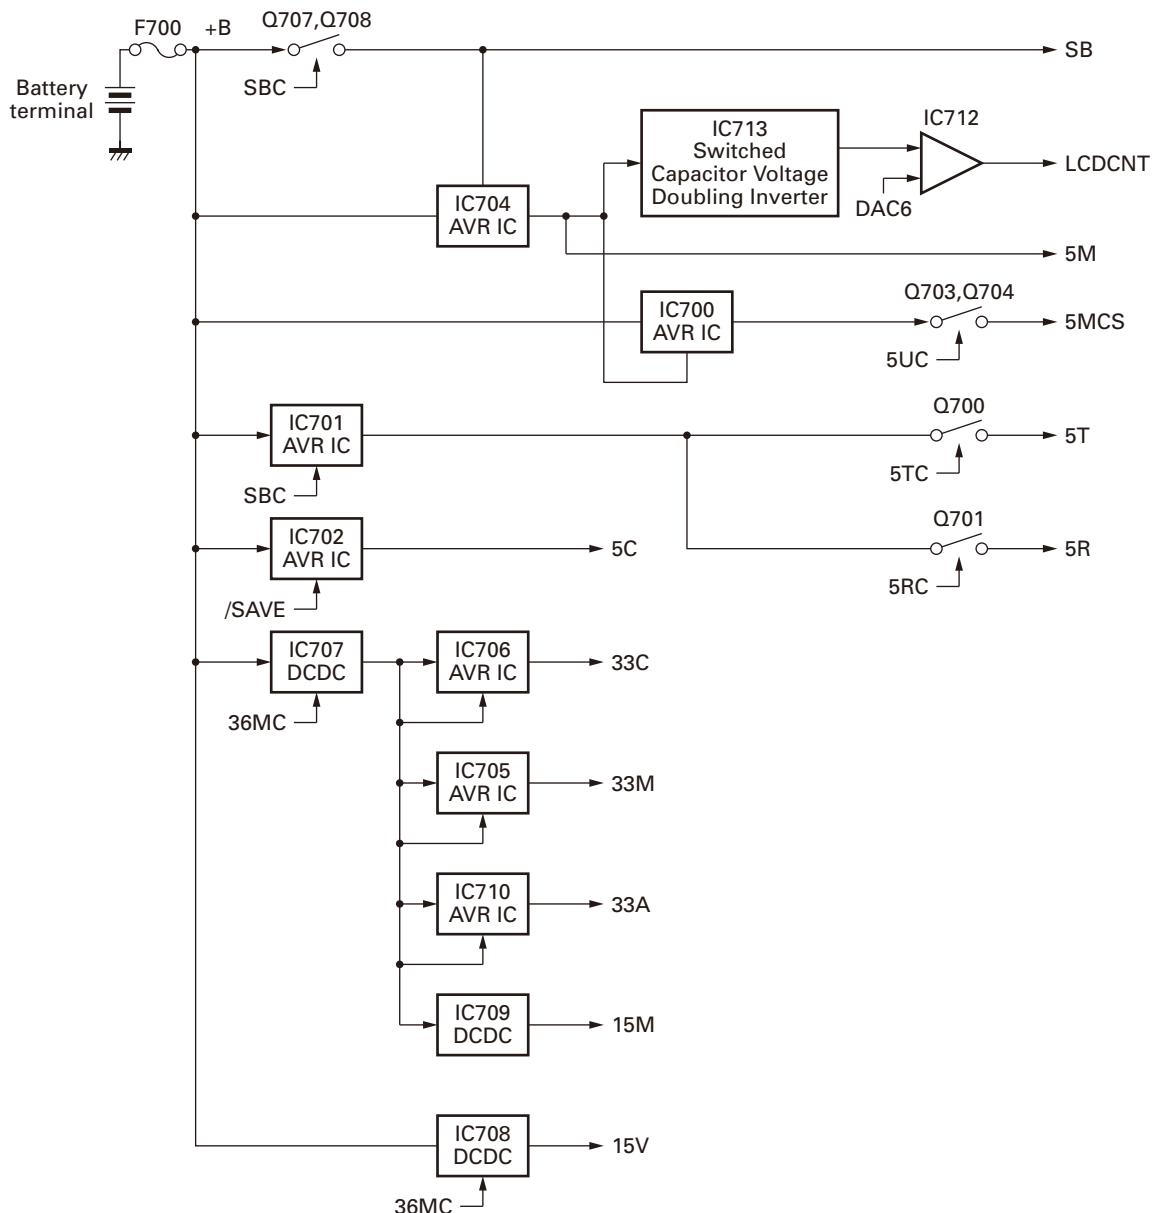

If +B voltage is detected above 5.6V by the voltage detection IC (IC16), IC17 CE pin (pin 6) becomes high and IC17 outputs 3.1V (pin 3). Additionally, when VOL SW is ON, the 3.6V and 15V DC/DC converter (IC707, IC708) CE pin (pin 4) becomes high and the 3.6V power source turns ON.

The output from the 3.6V DC/DC converter (IC707) provides the power source for three regulators (IC705, IC706, IC710) and 1.5V DC/DC converter (IC709). After these parts became ON, the Flash (IC1), DSP (IC3), SRAM (IC4), and

ASIC (IC10) start to operate. After the ASIC starts up, it begins controlling two regulators (IC701, IC702) with the SBC and/SAVE signals. After that, the two regulators (IC700, IC704) are controlled by the SB and 5M signals.

The output voltage from IC701 is switched by the 5RC signal (which is turned on while receiving) or the 5TC signal (which is turned on while transmitting). These signals are controlled by the ASIC (IC10).

The output voltage from IC700 is controlled by Q703 and Q704, and is used as a power source for 5MCS, for an optional accessory which is connected to the universal connector (CN505).

**Fig. 8 Power supply circuit**

## CIRCUIT DESCRIPTION

### 8. Signaling Circuit

#### 8-1. Encode (QT/DQT/DTMF)

Each data signal of QT, DQT and DTMF is generated by the DSP circuit, superimposed on a modulation signal and output from IC10. The modulation balance of the QT/DQT signal is adjusted by the D/A converter (IC502) and the resulting signal is routed to the modulation input of the VCO and TCXO (X100). Each deviation of the TX QT, DQT and DTMF tone is adjusted by changing the output level of IC108 and the resulting signal is routed to the VCO and TCXO.

#### 8-2. Decode (QT/DQT)

The audio signal is removed from the FM detection signal sent to the DSP circuit and the resulting signal is decoded.

### 9. Compander Circuit

The term "compander" means compressor and expander. The compander reduces noise by utilizing a compressor and an expander. The transceiver contains a DSP (IC3) to perform this operation. The transceiver compander can be turned on or off using the FPU.

# COMPONENTS DESCRIPTION

## Control unit (X53-4390-XX)

Ref. No.	Part Name	Description
IC1	IC	Flash memory
IC3	IC	DSP
IC4	IC	Static memory
IC5	IC	Voltage detector (RST)
IC6	IC	Buffer AMP (Logic)
IC7	IC	Real-time clock
IC8	IC	Clock buffer AMP
IC9	IC	Bus buffer (LCD)
IC10	IC	ASIC
IC11,12	IC	Audio AMP (BTL)
IC13	IC	Audio AMP (1/2 Audio pre-AMP, 2/2 NC MIC AMP)
IC15	IC	I/O Expander
IC16	IC	Voltage Detector (/BINT)
IC17	IC	Voltage regulator (3.1V)
IC18	IC	Bus buffer (LCD)
IC19	IC	5V to 3.3V Level convertor
Q1,2	Transistor	AVR for backlight LED
Q3,5	Transistor	5A AVR
Q4	FET	DC switch (5AC)
Q6	Transistor	Echo cancel MIC switch
Q7,8	FET	DC switch (/BINT,PSW)
Q10,11	FET	DC switch (BLED,TXLED)
Q12	Transistor	DC switch (36MC)
Q13,16	Transistor	DC switch
Q14	FET	DC switch (31BU)
Q15	FET	DC switch (STCAMI)
D1	Zener diode	AVR for backlight LED
D2~5	LED	Key backlight
D6~8	LED	LCD backlight
D9~12	LED	Key backlight
D13~16	Diode	Reverse current prevention
D19,20,22	Varistor	Surge absorption
D23~26	Diode	Reverse current prevention
D27	Varistor	Surge absorption

## TX-RX unit (X57-7560-10)

Ref. No.	Part Name	Description
IC100	IC	DC AMP
IC101	IC	PLL IC
IC200	IC	Buffer AMP (APC)
IC201	IC	APC AMP
IC300	IC	Mixer
IC304	IC	IF IC
IC306,307	IC	RX filter control
IC309,310	IC	RX band control switch
IC400	IC	IF AMP
IC500	IC	Buffer AMP (AFC/TCXO_MOD)
IC501	IC	5V to 3.3V Level convertor
IC502	IC	DAC
IC503	IC	A_SQL
IC505	IC	I/O Expander
IC506	IC	Buffer AMP (AF)
IC507~509	IC	AF pass control
IC510	IC	DC AMP/Summing AMP
IC511	IC	Logic switch
IC512	IC	Modulation
IC513	IC	Buffer AMP (MIC)
IC514	IC	Buffer AMP (VOX)
IC515	IC	MIC switch (/SCSW)
IC516	IC	Buffer AMP (MIC)
IC517	IC	Buffer AMP (Logic)
IC700	IC	AVR (5MCS)
IC701	IC	AVR (5T/5R)
IC702	IC	AVR (5C)
IC704	IC	AVR (5M)
IC705	IC	AVR (33M)
IC706	IC	AVR (33C)
IC707	IC	DC/DC converter (3.6V)
IC708	IC	DC/DC converter (15V)
IC709	IC	DC/DC converter (1.5V)
IC710	IC	AVR (33A)
IC712	IC	DC AMP (LCDCNT)
IC713	IC	DC/DC converter
IC714	IC	Temperature detection

## COMPONENTS DESCRIPTION

Ref. No.	Part Name	Description
Q100	Transistor	15V ripple filter
Q102	FET	PLL IC reset
Q103	FET	CV detection
Q104	Transistor	Ripple filter
Q105	FET	VCO control switch
Q106,107	FET	VCO
Q108	FET	VCO control switch
Q109	Transistor	RF AMP
Q111	Transistor	Double AMP
Q112	Transistor	RF AMP
Q200	Transistor	RF AMP
Q201	FET	RF AMP
Q202	FET	RF AMP (Drive AMP)
Q203	FET	APC switch
Q204	FET	RF AMP (Final AMP)
Q205	Transistor	DC switch (5M)
Q206	FET	APC
Q207	Transistor	APC switch
Q208	FET	APC switch
Q300	FET	RX band switch
Q302	FET	RF AMP (LNA)
Q303	Transistor	Tripler AMP
Q304	Transistor	Wide/Narrow control switch
Q305	FET	RF AMP (LNA)
Q308	FET	RX band switch
Q309	Transistor	IF AMP
Q311	Transistor	RX Isolator
Q312	Transistor	Local AMP
Q502	Transistor	SQL AMP
Q503	FET	TONE switch
Q504,505	Transistor	MIC AGC
Q506	FET	MIC mute switch
Q507,508	FET	Int/Ext MIC switch
Q509	FET	DC switch
Q700	FET	5TC
Q701	FET	5RC
Q703	FET	5MC
Q704	FET	5MCS switch
Q705	FET	DC/DC (15V)
Q706	FET	DC/DC (3.6V)
Q707	FET	DC switch
Q708	FET	DC switch
Q709	FET	15V switch

Ref. No.	Part Name	Description
D100~107	Variable capacitance diode	VCO (Frequency control)
D119	Diode	Assist DC
D200	Diode	TX/RX switch
D201	Zener diode	Surge absorption
D202,203	Diode	TX/RX switch
D303,304	Diode	TX/RX switch
D305	Diode	Protect of RF power
D308	Diode	TX/RX switch
D500	Diode	SQL
D501	Diode	PLD
D502,504	Zener diode	Surge absorption
D505	Diode	/PTT
D510	Diode	VOX
D511,512	Diode	MIC AGC
D515,516	Zener diode	Surge absorption
D517	Diode	VOX DC
D518,519	Diode	RXD1
D521	Diode	OPT6
D700	Diode	+B
D702	Diode	33M
D704	Diode	AVR CE (IC705, IC706, IC710)
D706	Diode	DC/DC converter (3.6V)
D901	LED	TX/RX LED

## EXPLODED VIEW

Parts with the exploded numbers larger than 700 are not supplied.

## PACKING

Parts with the exploded numbers larger than 700 are not supplied.

## TROUBLE SHOOTING

## Fault diagnosis of the BGA (Ball Grid Array) IC

## ■ Overview

A flowchart for determining whether or not the transceiver can be powered on (the LCD does not function even if the power switch is turned on) due to broken BGA parts.

## ■ BGA parts

ASIC (IC10), DSP (IC3), FLASH (IC1), SRAM (IC4)

When the BGA IC is problematic, please bring the printed circuit board (X53-4390-14 for 4-key, X53-4390-15 for DTMF key-pad) in for service.

## ● Checking power supply voltage

Checking voltage	
Points to be checked	Normal voltage
33M IC705 (5 pin)	3.3V
15M IC709 (4 pin)	1.5V
33A IC710 (5 pin)	3.3V
31BU IC17 (3 pin)	3.1V

Power supply of each device is connected through the coil.  
[ASIC]  
33M: L16, 15M: L17, 33A: L19  
[DSP]  
33M: L9, 15M: L5  
[FLASH]  
33A: L4  
[SRAM]  
31BU: L6

When an abnormal value is confirmed.

## Checking for an abnormal point

33M has an abnormal voltage.  
[ASIC]  
Remove L16 to check the voltage of the 33M.  
If the voltage becomes normal, the ASIC is broken.  
[DSP]

Remove L9 to check the voltage of the 33M.  
If the voltage becomes normal, the DSP is broken.

15M has an abnormal voltage.  
[ASIC]  
Remove L17 to check the voltage of the 15M.  
If the voltage becomes normal, the ASIC is broken.  
[DSP]  
Remove L5 to check the voltage of the 15M.  
If the voltage becomes normal, the DSP is broken.

33A has an abnormal voltage.  
[ASIC]  
Remove L19 to check the voltage of the 33A.  
If the voltage becomes normal, the ASIC is broken.  
[FLASH]  
Remove L4 to check the voltage of the 33A.  
If the voltage becomes normal, the FLASH is broken.

31BU has an abnormal voltage.  
[SRAM]  
Remove L6 to check the voltage of the 31BU.  
If the voltage becomes normal, the SRAM is broken.  
If the voltage is not corrected, there is a problem other than the BGA parts.

The BGA parts are not broken.

## ● Checking the clock

Checking the clock	
Points to be checked	Normal voltage (3.3V)
18.432MHz ASIC side R80	18.432MHz
DSP side R81	18.432MHz

32.768kHz IC7 (1 pin)  
32.768kHz

When a normal value is confirmed.

When an abnormal value is confirmed.

## ● Checking the Reset/Control signal

Checking the control signal input to the ASIC	
Points to be checked	Normal voltage
RESET IC5 (4 pin)	3.3V
/BINT Q7 (6 pin)	3.3V

PSW Q8 (3 pin)  
3.3V

When an abnormal value is confirmed.

If the /FRST is always 0V, the ASIC is broken.

If the /FRST repeats 3.3V and 0V at intervals, the ASIC, FLASH and SRAM may be broken.  
The BGA parts are not broken.

## Checking the control signal output from the ASIC

Points to be checked	Normal voltage
/FRST C22	3.3V

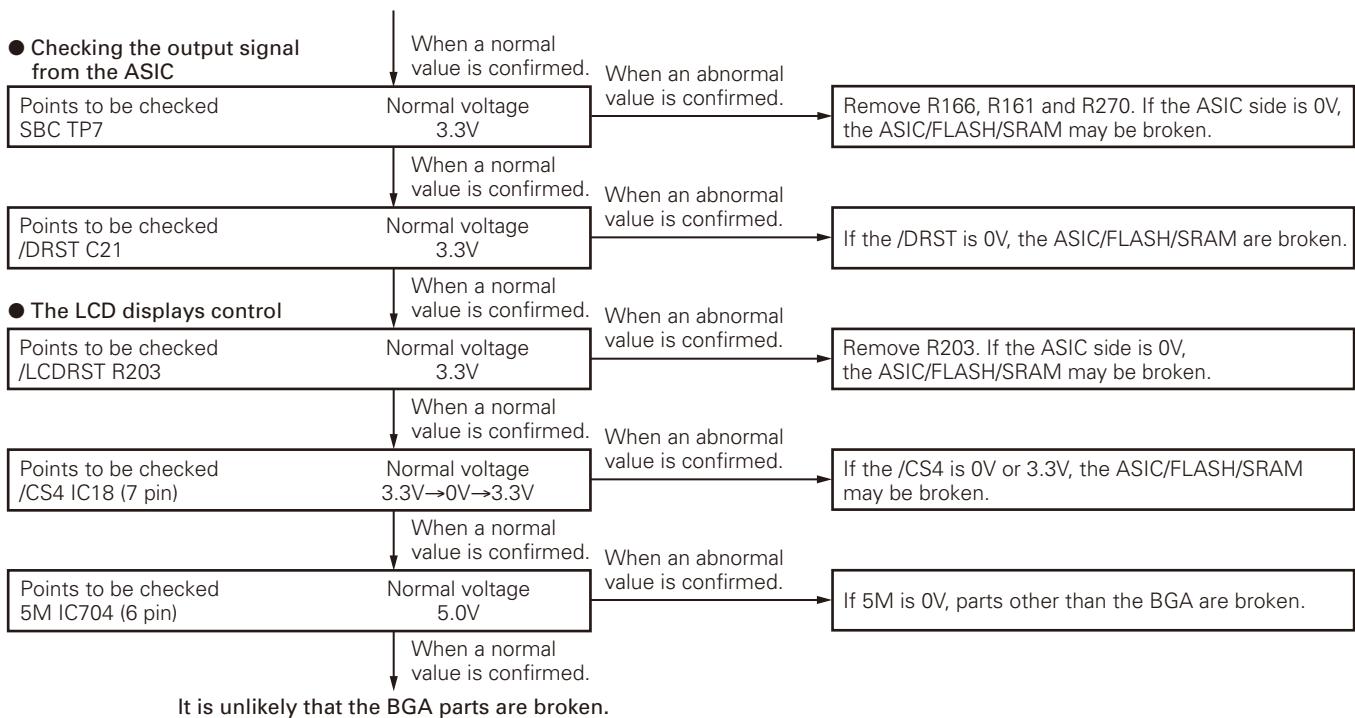

When a normal value is confirmed.

When an abnormal value is confirmed.

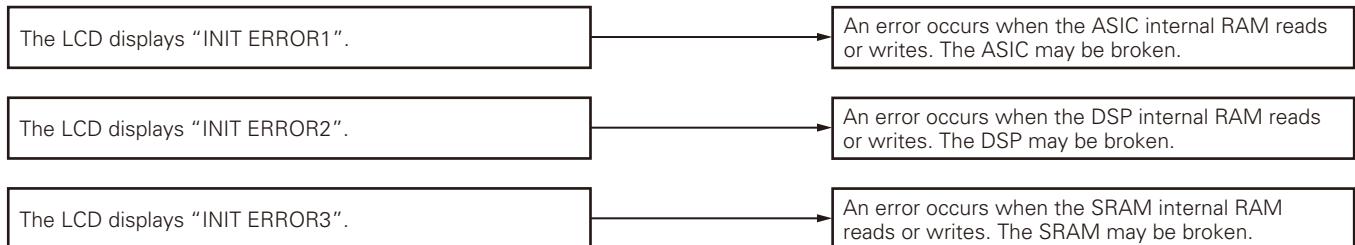

If the /FRST is always 0V, the ASIC is broken.

If the /FRST repeats 3.3V and 0V at intervals, the ASIC, FLASH and SRAM may be broken.  
The BGA parts are not broken.

# TROUBLE SHOOTING

● When an error display appears on the LCD.

## ■ Descriptions of signal names

- |                |                                     |                     |
|----------------|-------------------------------------|---------------------|
| 1) RST (RESET) | : ASIC reset signal                 | LOW → Reset         |
| 2) /BINT       | : Battery final voltage monitoring  | LOW → Final voltage |
| 3) PSW         | : Power switch signal               | HIGH → ON           |
| 4) /FRST       | : FLASH reset signal                | LOW → Reset         |
| 5) SBC         | : Switch B control                  | HIGH → ON           |

## Controls

## Panel Test Mode

## ■ Test mode operation features

This transceiver has a test mode. To enter test mode, press and hold the [Side3] and [PTT] keys while turning the transceiver power ON and then the [PTT] key first. Test mode can be inhibited by programming. To exit test mode, turn the transceiver power OFF.

- When the panel test mode is activated, the channel selected with the [Selector] knob and the last used signaling number are displayed. When it is activated for the first time, the signaling number is 1.
- If test signaling 26 (Tone Pattern) is selected, the result of Bit Error Rate (BER) calculation is displayed on the LCD. The BER value is also output from the serial port.
- The P25 and analog modes are switched automatically by selecting test signaling. When P25 mode is effective, "A" is displayed on the LCD.

## • Key operation

Key	Function	Display
[Selector]	Test frequency channel up/down	Channel No.
[Concentric switch]	Unused	-
[Lever switch]	Talk around switching (○: Talk around on, ●: Talk around off)	On: "T" icon appears
[PTT]	Transmit	-
[Side1]	Squelch level change (0→1→2→...→9→0→1→2→...)	Squelch level 0: "SQ.LV0" Squelch level 1: "SQ.LV1" Squelch level 9: "SQ.LV9"

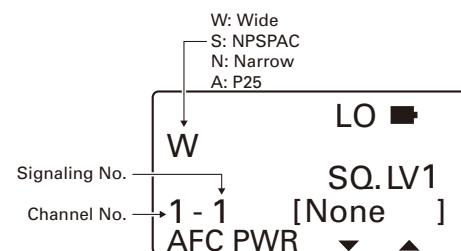

Key	Function	Display
[Side1] Hold	Squelch off	■
[Side2]	Bandwidth change (Wide→NPSPAC→Narrow→P25→Wide→...)	Wide: "W" NPSPAC: "S" Narrow: "N" P25: "A"
[Side2] Hold	Unused	-
[Side3]	Shifts to the Panel tuning mode	-
[Side3] Hold	LCD all lights	LCD all point appears
[Orange]	Beat shift on/off	On: ■ icon appears
[A]	AFC on/off *1	On: □ icon appears
[A] Hold	Compressor on/off	On: ■ icon appears
[B]	Transmit power switching (High→Low→Intinerant→High→...)	High: "HI" Low: "LO" Intinerant: " "
[C]	Test signaling down	Signaling No.
[D]	Test signaling up	Signaling No.
[0] to [9] and [#, *#]	Use as the DTMF keypad. If a key is pressed during transmission, the DTMF corresponding to the key that was pressed is sent.	

\*1 AFC is normally ON when used.

## • LED indicator

- |           |   |

## Panel Tuning Mode

The transceiver is adjusted in this mode.

## ■ Preparations for tuning the transceiver

Before attempting to tune the transceiver, connect the unit to a suitable power supply.

Whenever the transmitter is turned, the unit must be connected to a suitable dummy load (i.e. power meter).

The speaker output connector must be terminated with a  $8\Omega$  dummy load and connected to an AC voltmeter and an audio distortion meter or a SINAD measurement meter at all times during tuning.

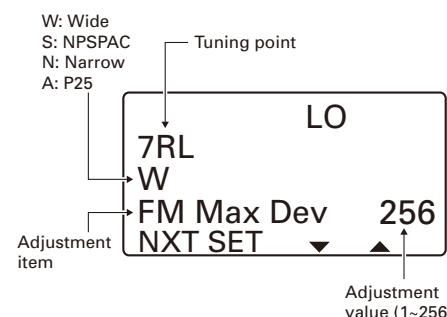

## ■ To enter the Panel Tuning Mode

Press the [Side3] key in the panel test mode.

Use the [B] key to write tuning data through tuning modes, and the [C] and [D] keys to adjust tuning requirements (1 to 256 appears on the LCD).

Use the [A] key to select the adjustment item through tuning modes. Use the [Side1] key to adjust 4, 6 or 8 reference level adjustments, and use the [Side2] key to switch between Wide/NPSPAC/Narrow/P25.

## • LCD display in the panel tuning mode

## ADJUSTMENT

## • Key operation

Key	Function
[Selector]	Unused
[Concentric switch]	Unused
[Lever switch]	Unused

## BER (Bit Error Rate) Measurement

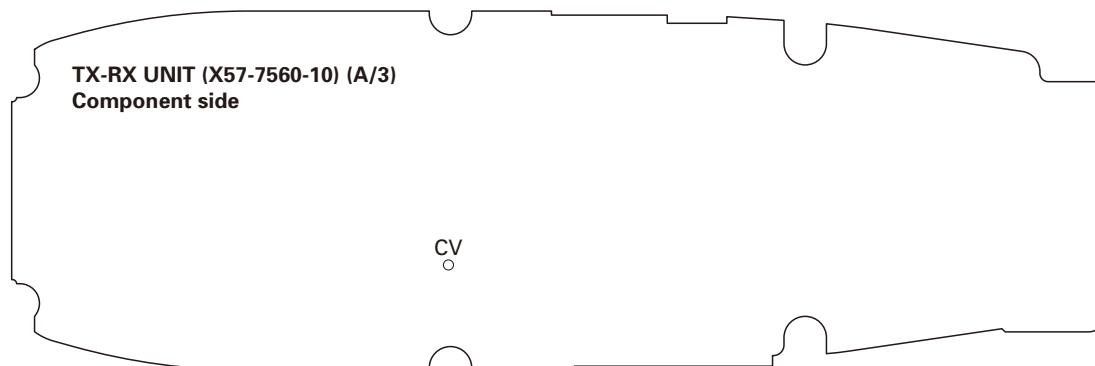

1. The Panel Test Mode is used to measure the BER (Refer "Test mode operation features" described on page 38.).
  2. Select "26" for test signaling (Refer to "Test Signaling" described on page 39.).
- When "26" is selected for the test signaling, the Bandwidth is automatically selected to "P25".  
(If there is no RF input signal, the display shows "500000".)
3. Select a filter (Refer to "Bandwidth" described on page 38.).
  4. Select a test frequency (Refer to "Test Frequency" described on page 39.).

5. Measure the BER (Bit Error Rate) using the digital radio tester. Enter a standard input signal into the transceiver as a standard tone test pattern.
6. Adjust the input signal level to achieve the standard bit error rate (BER).  
(For example, if the BER is 5%, the display shows "050000".)

## Adjustment Points

## C4FM (P25) Deviation Adjustment

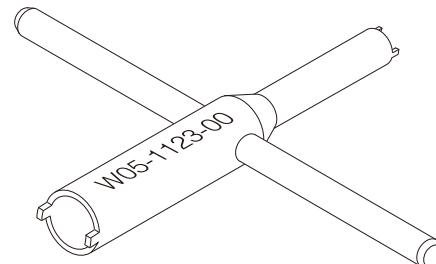

1. The transceiver adjusts the deviation between High Deviation  $\pm 1800\text{Hz}$  for the C4FM (P25).
2. The Symbol Rate Pattern is used when adjusting the High Deviation for the C4FM (P25) (Refer to "Test Signaling" described on page 39.). This test signal has a peak deviation equal to  $\pi/2 \cdot 1800\text{Hz} = 2827\text{Hz}$ .

## Service Jig

### ■ Nut wrench

In order to turn the volume nut and the channel selector nut, use a recommendation tool.

KENWOOD part No.: W05-1123-00

# ADJUSTMENT

## Test Equipment Required for Alignment

Test Equipment	Major Specifications	
1. Standard Signal Generator (SSG)	Frequency Range Modulation Output	700 to 900MHz Frequency modulation and external modulation -127dBm/0.1µV to greater than -47dBm/1mV
2. Power Meter	Input Impedance Operation Frequency Measurement Range	50Ω 700 to 900MHz or more Vicinity of 10W
3. Deviation Meter	Frequency Range	700 to 900MHz
4. Digital Volt Meter (DVM)	Measuring Range Input Impedance	10mV to 10V DC High input impedance for minimum circuit loading
5. Oscilloscope		DC through 30MHz
6. High Sensitivity Frequency Counter	Frequency Range Frequency Stability	10Hz to 1000MHz 0.2ppm or less
7. Ammeter		5A
8. AF Volt Meter (AF VTVM)	Frequency Range Voltage Range	50Hz to 10kHz 1mV to 10V
9. Audio Generator (AG)	Frequency Range Output	50Hz to 5kHz or more 0 to 1V
10. Distortion Meter	Capability Input Level	3% or less at 1kHz 50mV to 10Vrms
11. Spectrum Analyzer	Measuring Range	DC to 1GHz or more
12. Tracking Generator	Center frequency Output Voltage	50kHz to 900MHz 100mV or more
13. 8Ω Dummy Load		Approx. 8Ω, 3W
14. Regulated Power Supply		5V to 10V, approx. 3A Useful if ammeter equipped

### ■ The following parts are required for adjustment

#### 1. Antenna connector adapter

The antenna connector of this transceiver uses an SMA terminal.

Use an antenna connector adapter [SMA (f) – BNC (f) or SMA (f) – N (f)] for adjustment. (The adapter is not provided as an option, so buy a commercially-available one.)

#### Note:

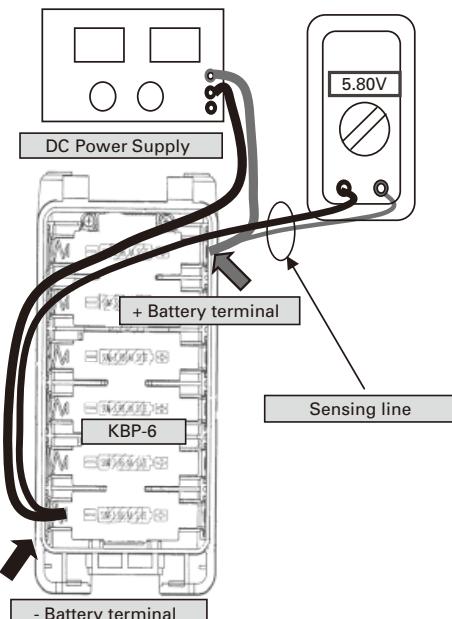

When the antenna connector adapter touches the knob, draw out the knob to mount the connector.

#### 2. Battery Jig

The optional KBP-6 battery case can be used as a battery JIG using the following modification (please refer to the following diagram).

<Recommendation for TX inhibit voltage adjustment and its check method>

We recommend that you increase the DC power supply voltage to about 0.2V higher than the "TX inhibit voltage" before pressing the PTT switch. Then press the PTT switch and decrease the DC power supply voltage to the target level (such as 5.8V) for the adjustment check in TX mode.

#### Notice:

The battery voltage for TX inhibit should be measured at the "Battery terminal", such as the sensing line, not the DC power supply terminal. Generally, there is approximately a 0.1 to 0.3 V loss through the cable, causing a difference between the DC power supply and the Battery terminal.

## ADJUSTMENT

### 3. Universal connector

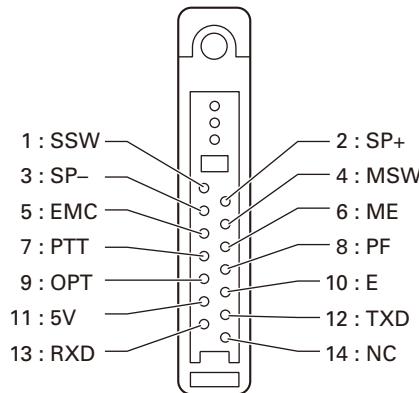

Use the interface cable (KPG-36/36A) for PC tuning or the lead wire with plug (E30-3287-28) and screw (N08-0535-08) for panel tuning. Connect the plug to the universal connector of the transceiver and tighten the screw.

The lead wire with plug (E30-3287-28) and screw (N08-0535-08) terminals are as follows. Numbers are universal connector terminal numbers.

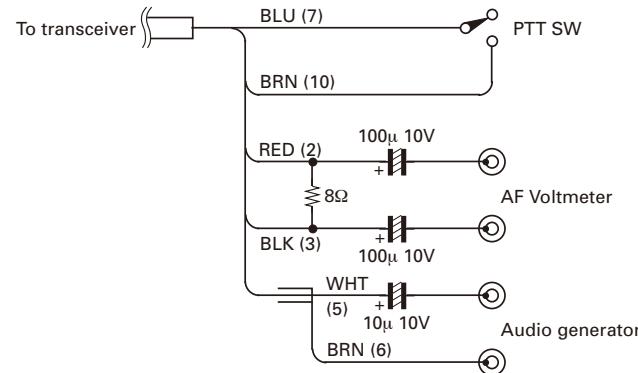

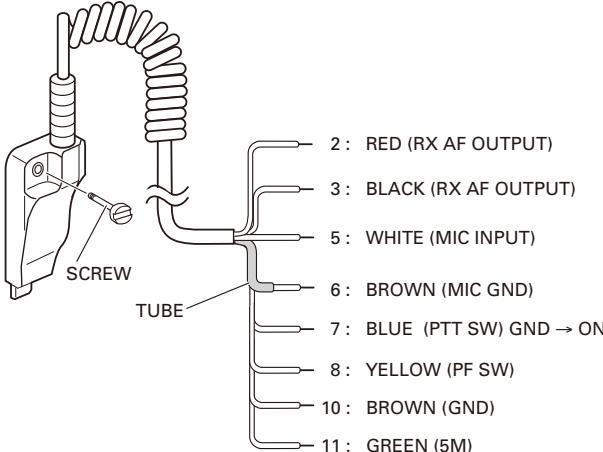

#### Caution

- When connecting the plug to the universal connector of the transceiver, a short circuit may occur. To prevent this, be sure to turn the transceiver POWER switch off.
- Since the RX AF output is a BTL output, there is a DC component. Isolate this with a capacitor or transformer as shown in the figure.
- Do not connect an instrument between red or black and GND.

#### • Universal connector

#### • Panel tuning

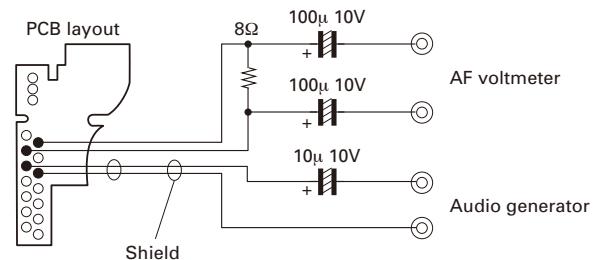

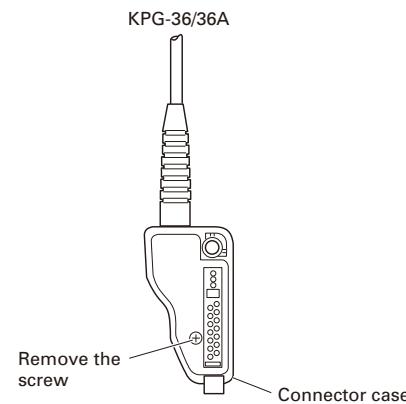

**Note:** Pin 1 (SSW) and Pin 4 (MSW) are connected to Pin 10 (GND) to active External SP and External MIC.

#### • PC tuning

Connect the wires to the PCB in the connector case of interface cable.

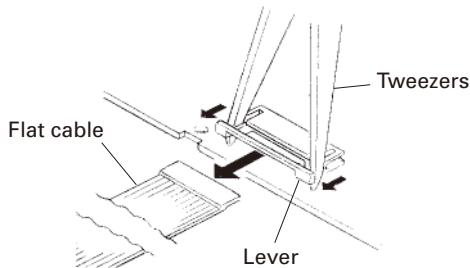

For output the wires out of the connector case, need to process the connector case.

# ADJUSTMENT

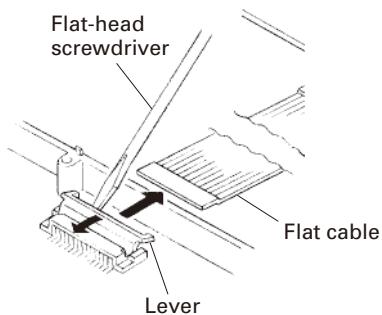

## How to Remove the Flat Cable

1. Gently draw out both sides of the connector lever uniformly in the direction of the arrow with tweezers.  
(CN1, CN35, CN38, CN505)

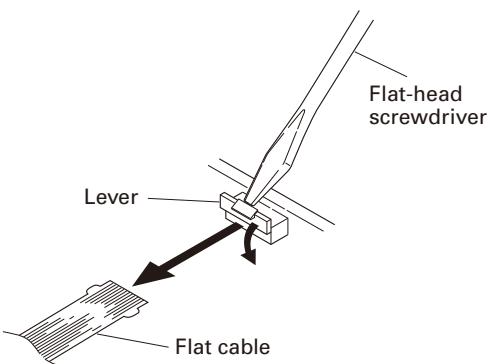

2. Gently rise up the connector lever in the direction of the arrow with a flat-head screwdriver or tweezers.  
(CN34)

Note: Gently push both sides of the connector lever, when put in the flat cable.

3. Gently depress the connector lever in the direction of the arrow with a flat-head screwdriver or tweezers.  
(CN902, CN903)

### **Component side view (J79-0230-09)**

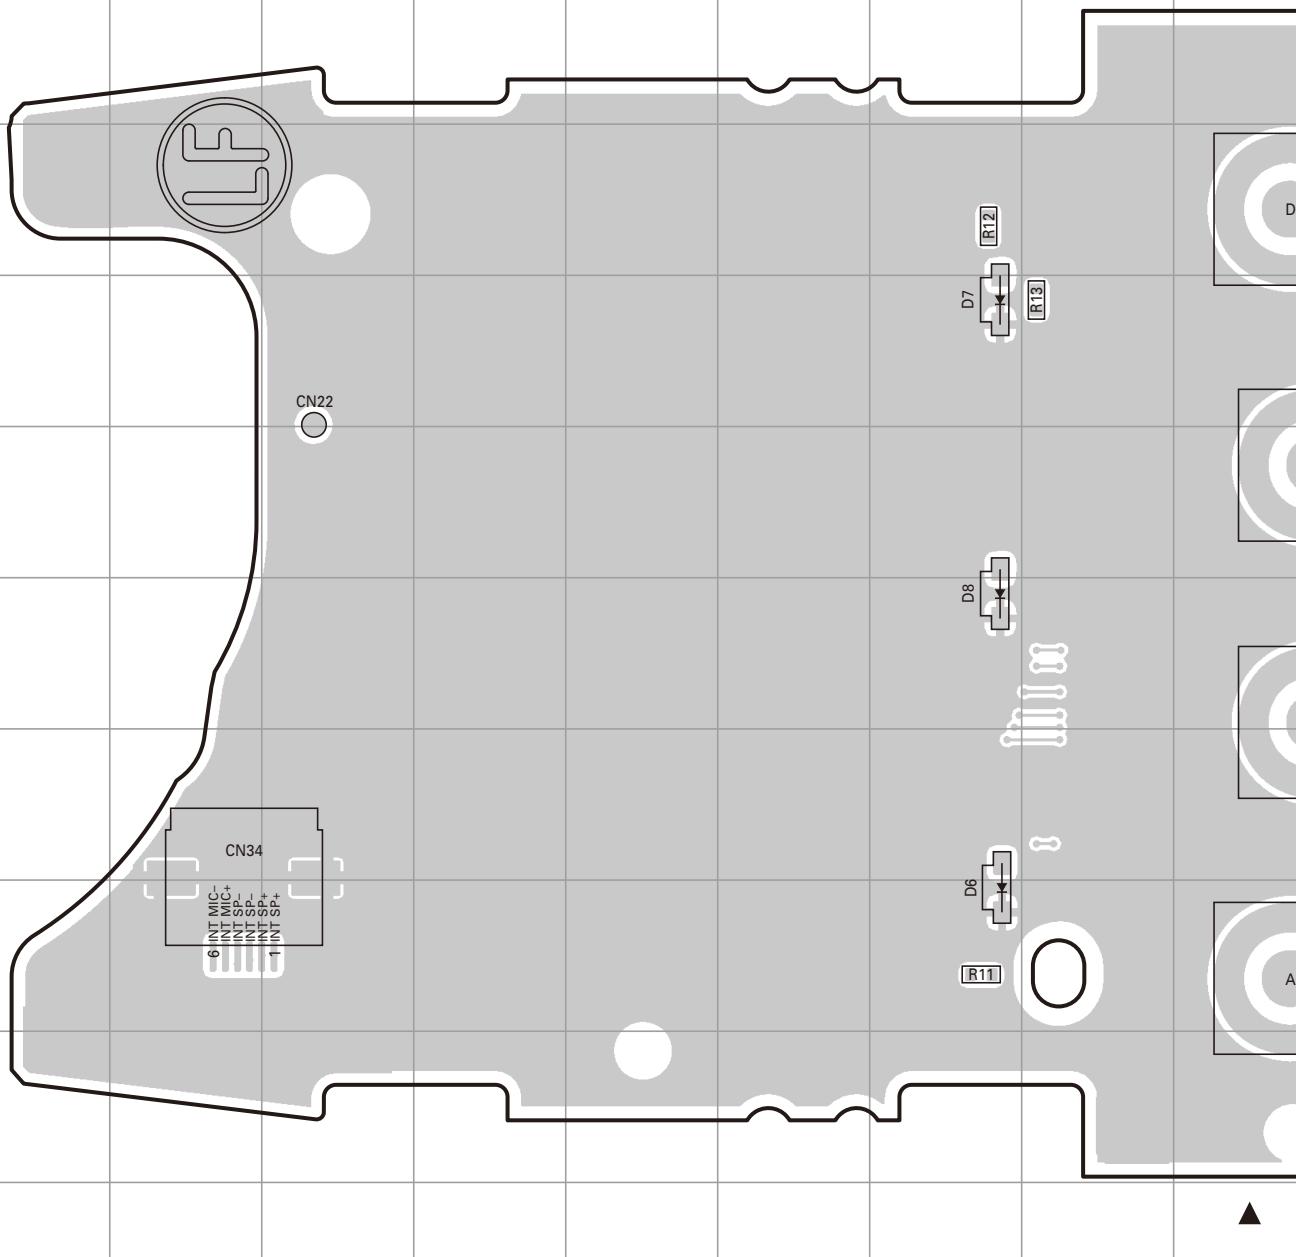

## Component side

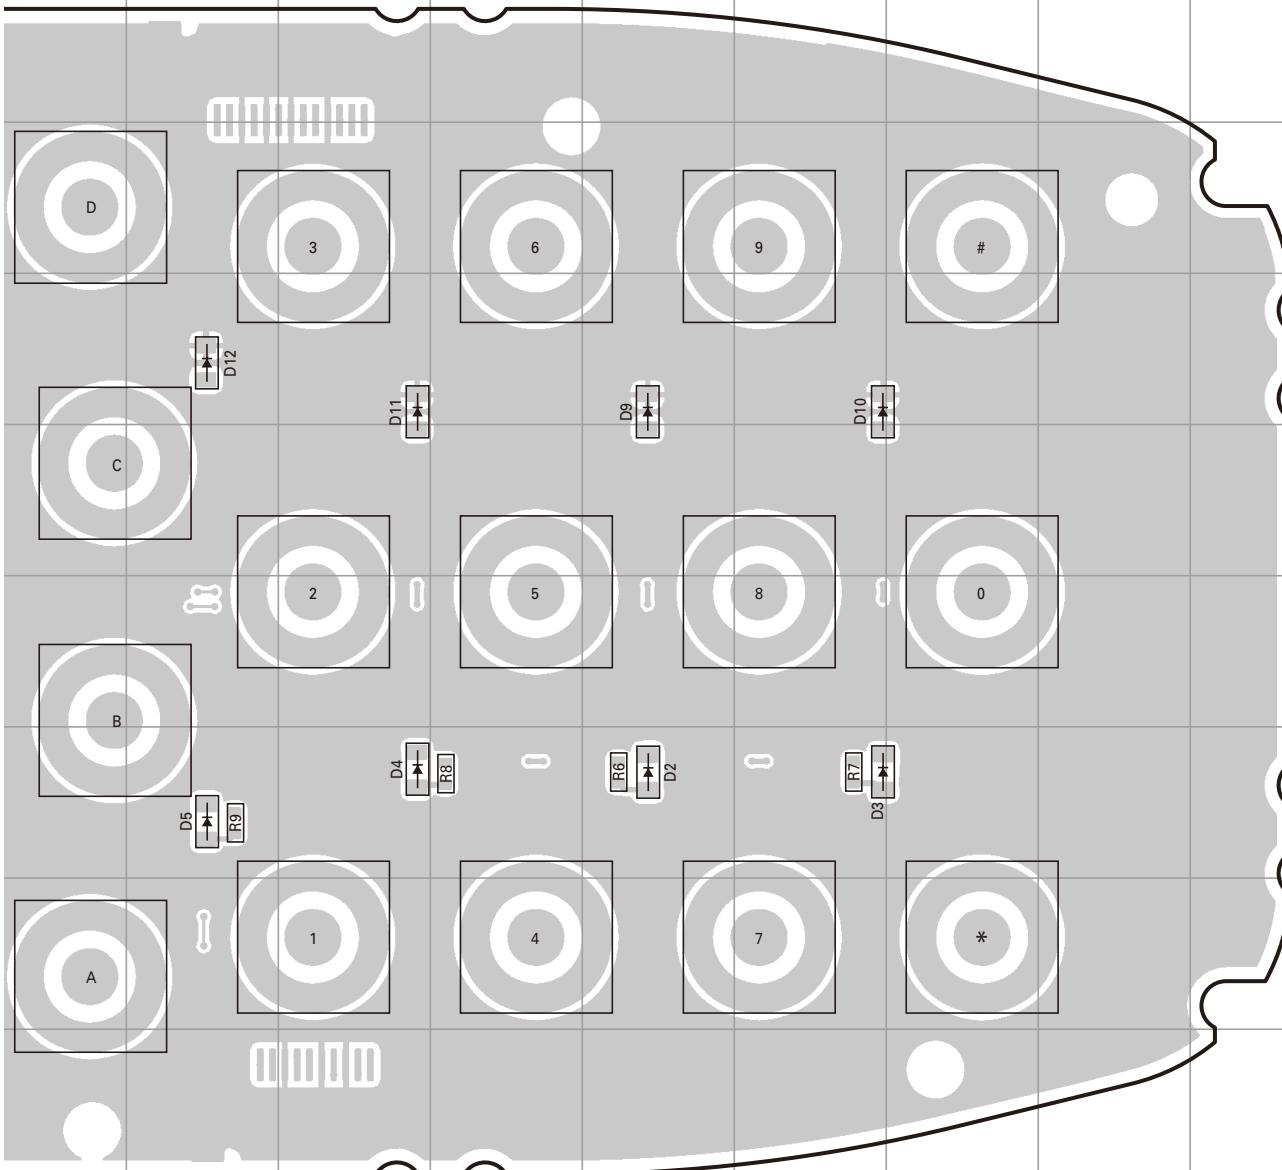

The diagram shows a vertical stack of eight horizontal bars, each representing a layer. The layers are labeled from top to bottom as Layer 1, Layer 2, Layer 3, Layer 4, Layer 5, Layer 6, Layer 7, and Layer 8. The first four layers (Layer 1 to Layer 4) are shaded in a light gray color, while the remaining four layers (Layer 5 to Layer 8) are white.

## LEVEL DIAGRAM

## Receiver Section

To make measurements in the AF section, connect the AC level meter.  
(ANT input: -53dBm, 1kHz FM, 3kHz DEV (Wide).)  
In the RF section, use 470pF coupling capacitor.  
(The display shows the SSG input value required to obtain 12dB SINAD.)

## Transmitter Section

AG is set to the MIC input becomes 3kHz DEV at 1kHz MOD.  
To make measurements in the AF section, connect the AC level meter.  
In the RF section, use 1000pF coupling capacitor.

## SPECIFICATIONS

### GENERAL

Models.....	K2: 4-Key w/LCD Model	K3: Full Key w/LCD Model
Frequency Range.....	763~776 MHz (TX/RX), 793~806 MHz (TX), 806~825 MHz (TX), 851~870 MHz (TX/RX)	
Number of Channels.....	1024	
Zones.....	100	
Max. Channels per Zone.....	512	
Channel Spacing.....	Analog: 12.5/25 kHz	Digital: 12.5 kHz
Operating Voltage .....	7.5V DC ± 20%	
Battery Life: 5-5-90 (10-10-80) duty cycle.....	KNB-32N or KNB-54N, 7.5VDC, 2500 mAh: 12 hours (8 hours) KNB-33L, 7.5VDC, 2000 mAh: 8 hours (5 hours) KBP-6, AA Alkaline x 6 Batteries: 8 hours (5 hours)	
Operating Temperature Range .....	-22°F to +140°F (-30°C to +60°C)	
Frequency Stability (-22°F to +140°F).....	±1.5 ppm	
Antenna Impedance .....	50Ω	
Dimensions (W x H x D) .....	2.28 x 6.10 x 1.80 in. (58 x 155 x 45.7 mm) with KNB-32N or KNB-54N battery (Projections not included) .....	2.28 x 6.10 x 1.54 in. (58 x 155 x 39.2 mm) with KNB-33L battery 2.36 x 6.10 x 1.84 in. (60 x 155 x 46.7 mm) with KBP-6 battery
Weight		
Radio only.....	TK-5410 K2: 11.64 oz. (330g)	
TK-5410 K3: 11.64 oz. (330g)		
TK-5410 K2 with battery, antenna (KRA-32) and belt clip (KBH-11) ....	23.28 oz. (660g) with KNB-32N or KNB-54N battery	
	17.64 oz. (500g) with KNB-54N battery	

### RECEIVER

Sensitivity .....	Digital (5% BER): 0.25µV	Digital (1% BER): 0.40µV
	Analog 12dB SINAD: 0.25µV	
Selectivity .....	Digital: -60dB	Analog @25kHz: -75dB
Intermodulation Distortion.....	-75dB	Analog @12.5kHz: -64dB
Spurious and Image.....	-75dB	
Audio Distortion.....	Digital: Less than 1.0%	Analog: Less than 2.0%
Audio Output .....	500mW/8Ω	

### TRANSMITTER

RF Output Power.....	3W/1W
Spurious & Harmonics.....	70dB
FM Hum & Noise.....	Analog @25kHz: 45dB
Audio Distortion.....	Less than 2.0%
Modulation Limiting.....	Analog @25kHz: ±5kHz
Modulation.....	Analog @12.5kHz: ±2.5kHz
	16K0F3E, 11K0F3E, 8K10F1E, 8K10F1D, 14K0F3E

Analog measurements made per TIA/EIA-603 and specifications shown are typical.

Digital measurements made per TIA/EIA-102CAAA

KENWOOD reserves the right to change specifications without prior notice or obligation.
