Firmware Copyrights

The title to and ownership of copyrights for firmware embedded in Kenwood product memories are reserved for Kenwood Corporation. Any modifying, reverse engineering, copy, reproducing or disclosing on an Internet website of the firmware is strictly prohibited without prior written consent of Kenwood Corporation. Furthermore, any reselling, assigning or transferring of the firmware is also strictly prohibited without embedding the firmware in Kenwood product memories.

Transceivers containing AMBE+2™ Vocoder:

The AMBE+2™ voice coding technology is embedded in the firmware under the license of Digital Voice Systems, Inc.

GENERAL

INTRODUCTION

SCOPE OF THIS MANUAL

This manual is intended for use by experienced technicians familiar with similar types of commercial grade communications equipment. It contains all required service information for the equipment and is current as of the publication date. Changes which may occur after publication are covered by either Service Bulletins or Manual Revisions. These are issued as required.

ORDERING REPLACEMENT PARTS

When ordering replacement parts or equipment information, the full part identification number should be included. This applies to all parts: components, kits, or chassis. If the part number is not known, include the chassis or kit number of which it is a part, and a sufficient description of the required component for proper identification.

PERSONAL SAFETY

The following precautions are recommended for personal safety:

- DO NOT transmit if someone is within two feet (0.6 meter) of the antenna.
- DO NOT transmit until all RF connectors are secure and any open connectors are properly terminated.
- SHUT OFF this equipment when near electrical blasting caps or while in an explosive atmosphere.
- All equipment should be properly grounded before power-up for safe operation.
- This equipment should be serviced by only qualified technicians.

PRE-INSTALLATION CONSIDERATIONS

1. UNPACKING

Unpack the radio from its shipping container and check for accessory items. If any item is missing, please contact KENWOOD immediately.

2. LICENSING REQUIREMENTS

Federal regulations require a station license for each radio installation (mobile or base) be obtained by the equipment owner. The licensee is responsible for ensuring transmitter power, frequency, and deviation are within the limits permitted by the station license.

Transmitter adjustments may be performed only by a licensed technician holding an FCC first, second or general class commercial radiotelephone operator's license. There is no license required to install or operate the radio.

3. PRE-INSTALLATION CHECKOUT

3-1. Introduction

Each radio is adjusted and tested before shipment. However, it is recommended that receiver and transmitter operation be checked for proper operation before installation.

3-2. Testing

The radio should be tested complete with all cabling and accessories as they will be connected in the final installation. Transmitter frequency, deviation, and power output should be checked, as should receiver sensitivity, squelch operation, and audio output. Signaling equipment operation should be verified.

GENERAL

4. PLANNING THE INSTALLATION

4-1. General

Inspect the vehicle and determine how and where the radio antenna and accessories will be mounted.

Plan cable runs for protection against pinching or crushing wiring, and radio installation to prevent overheating.

4-2. Antenna

The favored location for an antenna is in the center of a large, flat conductive area, usually at the roof center. The trunk lid is preferred, bond the trunk lid and vehicle chassis using ground straps to ensure the lid is at chassis ground.

4-3. Radio

The universal mount bracket allows the radio to be mounted in a variety of ways. Be sure the mounting surface is adequate to support the radio's weight. Allow sufficient space around the radio for air cooling. Position the radio close enough to the vehicle operator to permit easy access to the controls when driving.

4-4. DC Power and wiring

1. This radio may be installed in negative ground electrical systems only. Reverse polarity will cause the cable fuse to blow. Check the vehicle ground polarity before installation to prevent wasted time and effort.
2. Connect the positive power lead directly to the vehicle battery positive terminal. Connecting the Positive lead to any other positive voltage source in the vehicle is not recommended.
3. Connect the ground lead directly to the battery negative terminal.
4. The cable provided with the radio is sufficient to handle the maximum radio current demand. If the cable must be extended, be sure the additional wire is sufficient for the current to be carried and length of the added lead.

5. INSTALLATION PLANNING – CONTROL STATIONS

5-1. Antenna system

Control station. The antenna system selection depends on many factors and is beyond the scope of this manual. Your KENWOOD dealer can help you select an antenna system that will best serve your particular needs.

5-2. Radio location

Select a convenient location for your control station radio which is as close as practical to the antenna cable entry point. Secondly, use your system's power supply (which supplies the voltage and current required for your system). Make sure sufficient air can flow around the radio and power supply to allow adequate cooling.

SERVICE

This radio is designed for easy servicing. Refer to the schematic diagrams, printed circuit board views, and alignment procedures contained in this manual.

NOTE

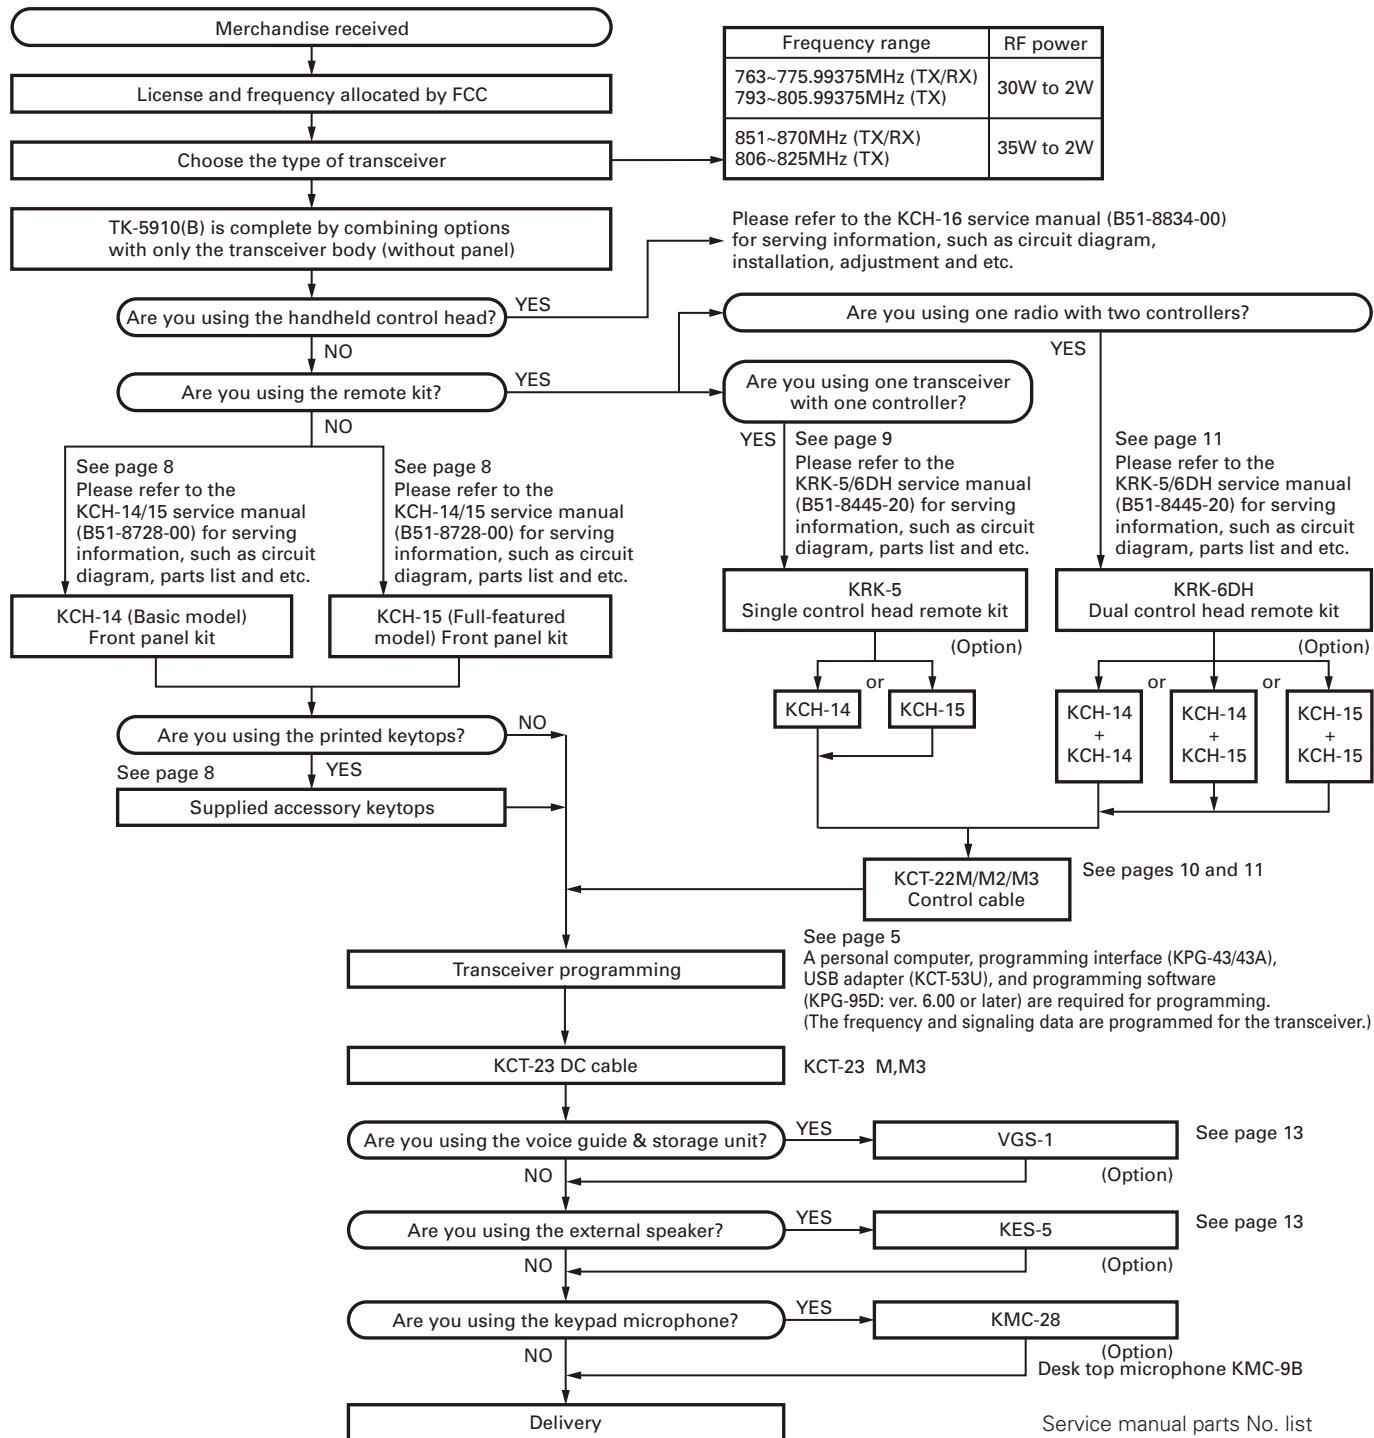

You must use KPG-95D version 6.00 or later for this transceiver. KPG-95D versions earlier than version 6.00 will not work properly.

SYSTEM SET-UP

Before Reading About System Set-up

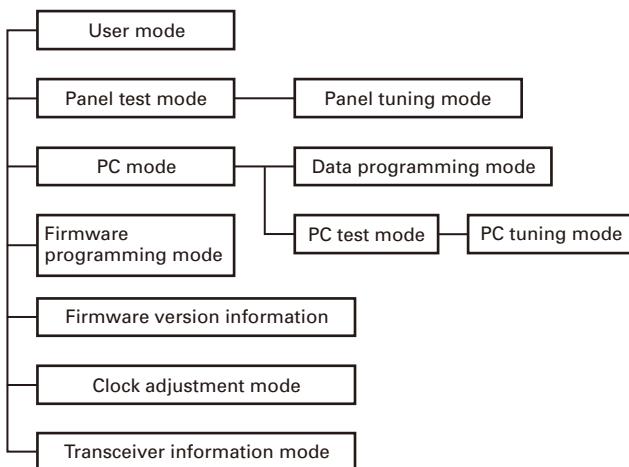

The TK-5910(B) is a transceiver main unit (without a panel or speaker) that you complete by adding options.

The options are classified into three types according to operation and function.

REALIGNMENT

1. Modes

Mode	Function
User mode	For normal use.
Panel test mode	Used by the dealer to check the fundamental characteristics.
Panel tuning mode	Used by the dealer to tune the transceiver.
PC mode	Used for communication between the transceiver and PC.
Data programming mode	Used to read and write frequency data and other features to and from the transceiver.
PC test mode	Used to check the transceiver using the PC. This feature is included in the FPU. See panel tuning.
Firmware programming mode	Used when changing the main program of the flash memory.
Firmware version information	Used to confirm the internal firmware version.
Clock adjustment mode	Used by the dealer to adjust date and time.
Transceiver information mode	Used to confirm the transceiver firmware version.

2. How to Enter Each Mode

Mode	Operation
User mode	Power ON
Panel test mode	[PF1] + Power ON
PC mode	Received commands from PC
Panel tuning mode	[Panel test mode] + [GRP \wedge]
Firmware programming mode	[PF2] + Power ON
Firmware version information	[PF3] + Power ON
Clock adjustment mode	[PF4] + Power ON
Transceiver information mode	[PF1] + [PF3] + Power ON

3. Panel Test Mode

Setting method refer to ADJUSTMENT.

4. Panel Tuning Mode

Setting method refer to ADJUSTMENT.

5. PC Mode

5-1. Preface

The transceiver is programmed by using a personal computer, programming interface (KPG-43/43A), USB adapter (KCT-53U) and programming software (KPG-95D: ver. 6.00 or later).

The programming software can be used with a PC. Figure 1 shows the setup of a PC for programming.

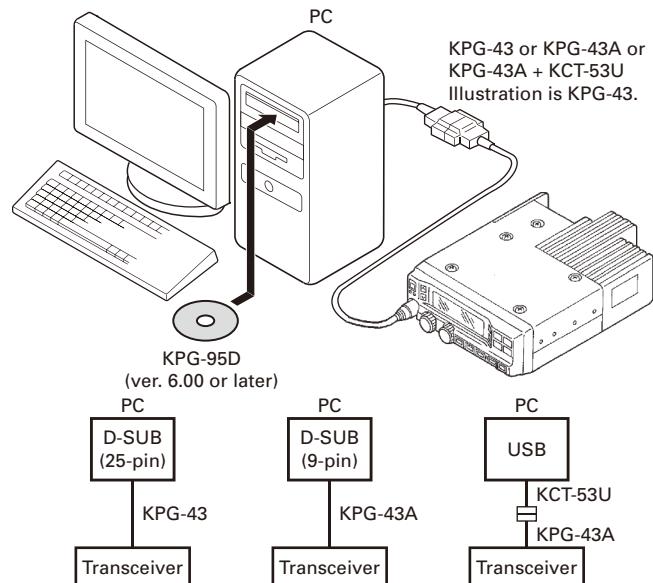

Fig. 1

TK-5910(B)

REALIGNMENT

5-2. Connection procedure

1. Connect the transceiver to the computer using the interface cable and USB adapter (When the interface cable is KPG-43A, the KCT-53U can be used.).

Note:

- You must install the KCT-53U driver in the computer to use the USB adapter (KCT-53U).
 - When using the USB adapter (KCT-53U) for the first time, plug the KCT-53U into a USB port on the computer with the computer power ON.
2. When the POWER switch on, user mode can be entered immediately. When PC sends command the transceiver enter PC mode, and "PROGRAM" is displayed on the LCD. When data transmitting from transceiver, the red LED is lights. When data receiving to transceiver, the green LED is lights.

Note:

The data stored in the computer must match the "Model Name and Market Code" when it is written into the flash memory.

5-3. KPG-43/KPG-43A description

(PC programming interface cable: Option)

The KPG-43/43A is required to interface the transceiver to the computer. It has a circuit in its D-sub connector (KPG-43: 25-pin, KPG-43A: 9-pin) case that converts the RS-232C logic level to the CMOS level.

The KPG-43/43A connects the microphone jack of the transceiver to the RS-232C serial port of the computer.

5-4. KCT-53U description (USB adapter: Option)

The KCT-53U is a cable which connects the KPG-43A to a USB port on a computer.

When using the KCT-53U, install the supplied CD-ROM (with driver software) in the computer. The KCT-53U driver runs under Windows 2000, XP or Vista (32-bit).

5-5. Programming software KPG-95D description

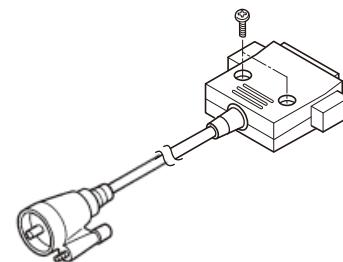

The KPG-95D (ver. 6.00 or later) is the programming software for the transceiver supplied on a CD-ROM. This software runs under MS-Windows 98, ME, Windows NT4.0, 2000, XP or Vista (32-bit) on a PC.

The data can be input to or read from the transceiver and edited on the screen. The programmed or edited data can be printed out. It is also possible to tune the transceiver.

6. PC Tuning Mode

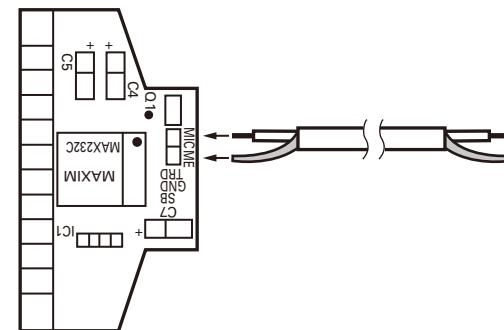

When making adjustment while in PC tuning mode, modify the KPG-43/43A programming interface cable as described below.

1. Remove the two screws from the plug cover, then lift the cover from the plug.

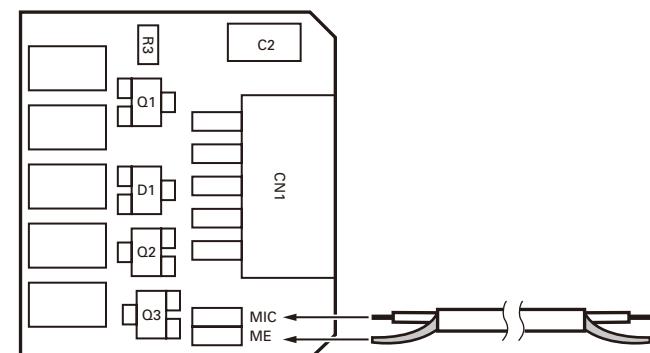

2. Solder the lead wire onto the MIC tab on the PCB, and the ground wire onto the ME tab.

- KPG-43

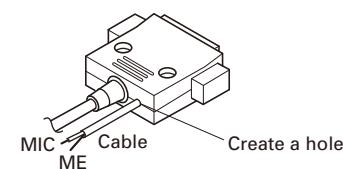

- KPG-43A

- 3.

- KPG-43

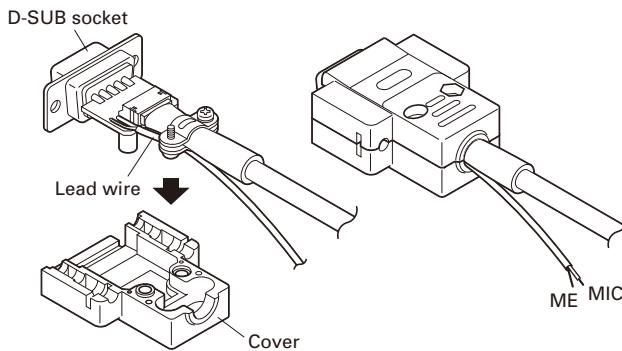

Create a hole in the casing (as shown in the illustration) then fit the cable into the hole. Replace the cover and secure it using the two screws.

REALIGNMENT

- KPG-43A

Install the D-SUB socket into the cover after aligning the lead wire as shown in the figure.
Replace the cover and secure it using the two screws.

7. Firmware Programming Mode

7-1. Preface

Flash memory is mounted on the transceiver. This allows the transceiver to be upgraded when new features are released in the future. (For details on how to obtain the firmware, contact Customer Service.)

7-2. Connection procedure

Connect the transceiver to the personal computer (PC) using the interface cable (KPG-43/43A) and USB adapter (KCT-53U: When the interface cable is KPG-43A, the KCT-53U can be used.). (Connection is the same as in the PC Mode.)

7-3. Programming

1. Start up the firmware programming software (Fpro.exe).
2. Set the communications speed (normally, 115200 bps) and communications port in the configuration item.
3. Set the firmware to be updated by File name item.
4. Press and hold the [PF2] key while turning the transceiver power ON. Then, the orange LED on the transceiver lights and "PROGRAM FIRM" is displayed.
5. Check the connection between the transceiver and the personal computer, and make sure that the transceiver is in the Program mode.
6. Press "write" button in the window. When the transceiver starts to receive data, the [PG] display is blinking.
7. If writing ends successfully, the checksum is calculated and a result is displayed.
8. If you want to continue programming other transceivers, repeat steps 4 to 7.

Note:

- This mode cannot be entered if the Firmware Programming mode is set to Disable in the Programming software.
- These transceivers use firmware versions G5.00 or later. When using firmware versions earlier than version G5.00, a "Check connection" error message will appear on the LCD. Firmware versions earlier than version G5.00 will not write to the transceiver.

- While the firmware is being written, if the transceiver resets due to a power supply interruption or other problem, the LCD may not display correctly (for example, "PROGRAM FIRM" may not display).

Additionally, transceiver keys other than the power switch cannot be operated.

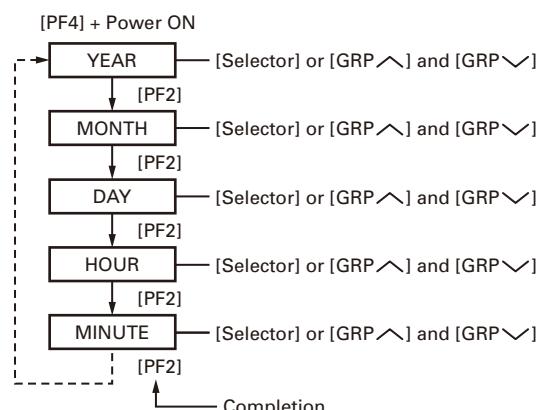

To return to normal operation, click the "Cancel" button in the firmware programming software, then turn the transceiver power OFF and back ON. "PROGRAM FIRM" reappears on the display and the transceiver keys can be operated. However, the previously written firmware data is lost; you must write the firmware using the firmware programming software again.

8. Firmware Version Information

Press and hold the [PF3] key while turning the transceiver power ON and then keep pressing and holding the [PF3] key, the firmware version information appears on the LCD.

9. Clock Adjustment Mode

9-1. Flow chart of operation

10. Transceiver Information Mode

Use this function to confirm the transceiver firmware version.

1. Press and hold the [PF1] and [PF3] keys while turning the transceiver power ON.
2. The transceiver firmware version appears on the LCD.
3. To exit the transceiver information mode, turn the transceiver power OFF.

INSTALLATION

1. Front Panel Kit (KCH-14/15: Option)**1-1. Installing the KCH-14/15 front panel kit to the transceiver**

1. Remove the upper case and lower case of the transceiver.
2. Insert the lead wire with connector (W700) of the control unit (X53-440) into the connector (CN1) of the KCH-14 or KCH-15.
3. Install the KCH-14 or KCH-15 on the transceiver using the four screws ① supplied with the front panel kit.

Note:

Take care that the lead wire with connector (W700) is not caught when fitting the KCH-14 or KCH-15 on the transceiver. (You can install the panel upside down if necessary to install the transceiver.)

4. Affixing the sheet (G11-4379-04) for the waterproof (Fig.1-1-2).

- (1) Remove the covering paper of the sheet ②.
- (2) Affix the sheet while taking note of the position of the three parts as shown in Fig.1-1-2 ③.
- Firmly affix the sheet to the chassis by pushing the double-coated tape with your fingers.
- (3) Repeat step (2) to affix the sheet to the other side of chassis.

Note:

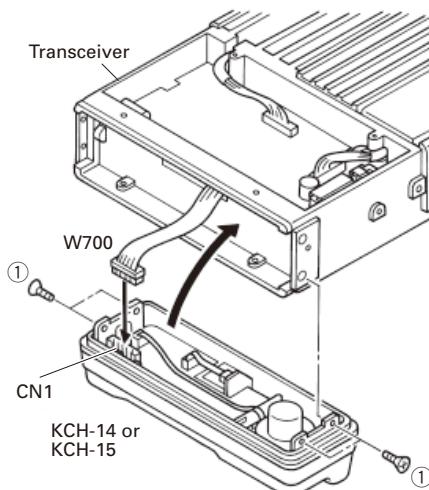

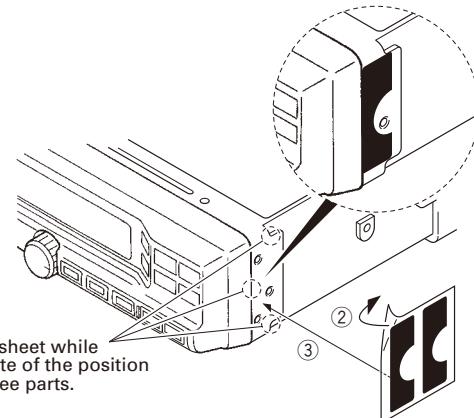

The sheet cannot be reused. Affix a new sheet when you removed the sheet.

5. Reassemble the upper case and lower case. (Refer to page 18)

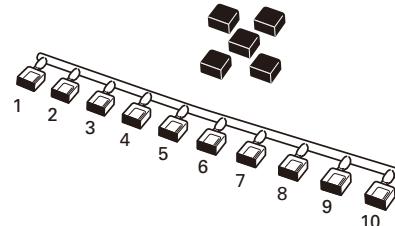

Note:

Take care that the sheet (G11-4379-04) is not peeled off when installing the upper/lower case.

6. Connect the short plug to the accessory connector (9-pin) on the rear of the transceiver.

**Fig. 1-1-1****Fig. 1-1-2****1-2. Installing the accessory keytops to the front panel kit**

When a function is set by the programming software (KPG-95D), the key legend can be changed by inserting the accessory keytops into PF1 to PF9 of the KCH-15 (PF1 to PF5: KCH-14). The accessory contains 60 keytops as shown the table below.

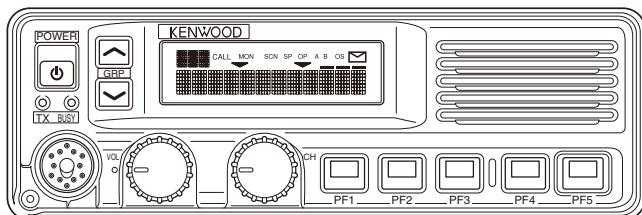

**Fig. 1-2**

INSTALLATION

KCH-14

KCH-15

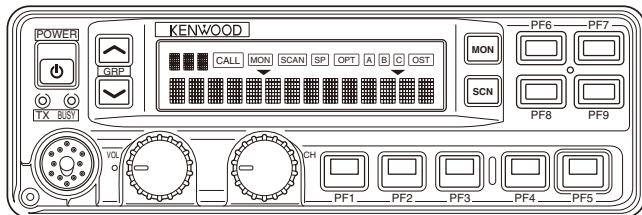

Fig. 1-3

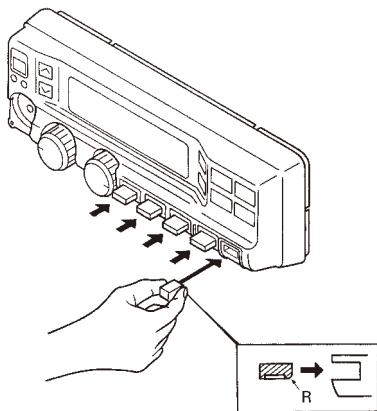

Fig. 1-4 Keytop insertion

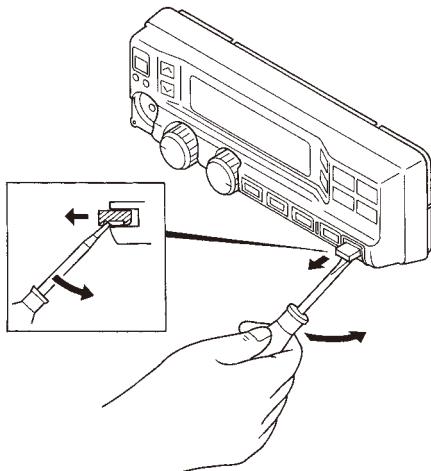

Fig. 1-5 Keytop removal

2. Remote kit (KRK-5: Option)

The KRK-5 remote kit is used to remotely operate the transceiver. The KRK-5 is connected to the KCH-14 or KCH-15 with an optional KCT-22M (8 feet), KCT-22M2 (17 feet), or KCT-22M3 (25 feet) control cable.

2-1. Installing the KRK-5 main panel onto the transceiver

1. Remove the upper case and lower case of the transceiver.
2. Insert the lead wire with connector (W700) of the control unit (X53-440) into the connector (CN4) of the KRK-5.
3. Install the KRK-5 main panel on the transceiver using four screws ①.

Note:

Take care that the lead wire with connector (W700) is not caught when fitting the KRK-5 main panel on the transceiver.

4. Affixing the sheet (G11-4379-04) for the waterproof (Fig.2-1-2).
 - (1) Remove the covering paper of the sheet ②.
 - (2) Affix the sheet while taking note of the position of the three parts as shown in Fig.2-1-2 ③.
 - Firmly affix the sheet to the chassis by pushing the double-coated tape with your fingers.
 - (3) Repeat step (2) to affix the sheet to the other side of chassis.

Note:

The sheet cannot be reused. Affix a new sheet when you removed the sheet.

5. Reassemble the upper case and lower case of the transceiver. (Refer to page 18)

Note:

Take care that the sheet (G11-4379-04) is not peeled off when installing the upper/lower case.

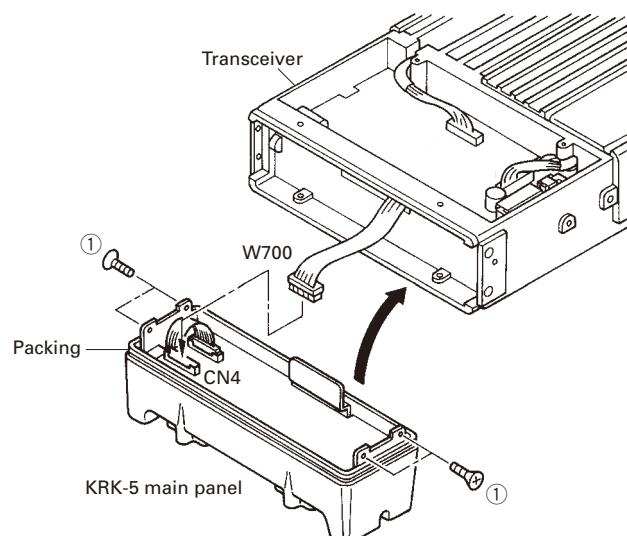

Fig. 2-1-1

INSTALLATION

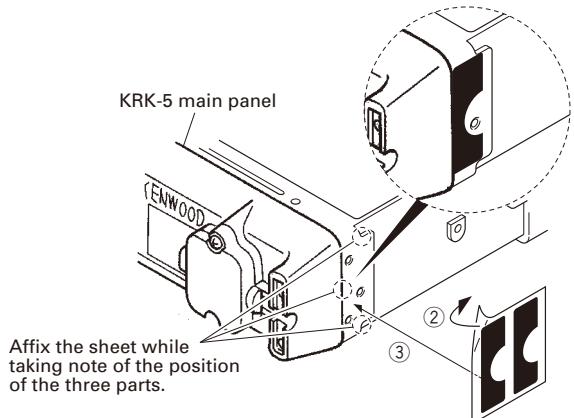

Fig. 2-1-2

2-2. Installing the KRK-5 rear panel onto the front panel kit

The following steps apply to both the KCH-14 and KCH-15.

1. Remove three screws ① on the KRK-5 rear panel, then remove the KRK-5 sub panel.
2. Insert the lead wire with connector (W102) of the KRK-5 into the connector (CN1) of the front panel kit ②.
3. Insert the lead wire with connector (W103) of the KRK-5 into the connector (CN3) of the front panel kit ③.
4. Make a slight cut in the end of the rubber cap ④.
5. Slide the lead wire of the connector wiring ⑤ through the slit in the rubber cap ⑥.
6. Insert the rubber cap into the hole of the KRK-5 rear panel ⑦.
7. Insert the connector ⑧ to the ACC connector ⑨ on the KRK-5 sub panel as shown by the arrow ⑩.
8. Install the KRK-5 sub panel onto the sub panel of the front panel kit ⑪.
9. Install the KRK-5 sub panel to the sub panel of the front panel kit using four screws ⑫.
10. Reinstall the KRK-5 rear panel using three screws removed in step 1.
11. Use a wire band to secure the lead wire at the end of the rubber cap ⑬.

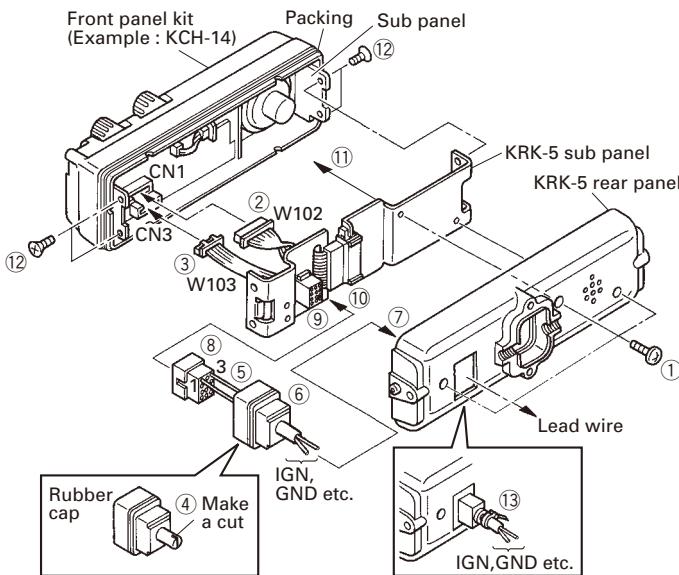

Fig. 2-2

2-3. Control cable (KCT-22) connection (Fig. 2-3)

1. Insert one connector of the control cable to the transceiver (with KRK-5) and the other to the display. Connect the cable to the GND terminal with the screw ① supplied with the control cable.
2. Secure the one connector of the control cable to the KRK-5 main panel with two screws ② according to the installation condition of the transceiver. Secure the control cable to the KRK-5 main panel with the cable fitting (J21-4354-04) and two screws ③ supplied with the KRK-5.
3. Secure the other connector of the control cable to the display with two screws ④ in the same way.

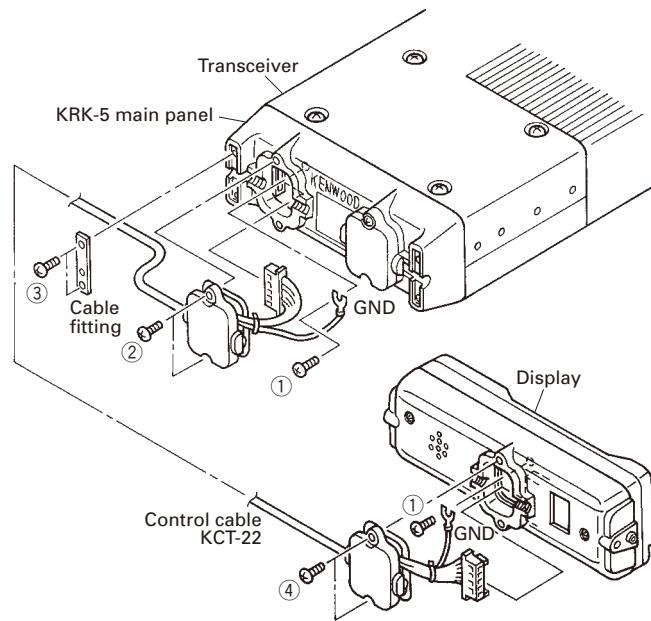

Fig. 2-3

2-4. Display installation (Fig. 2-4)

1. Install the display with the angle bracket (J29-0648-03) ① and two screws (N08-0526-04) ② supplied with the KRK-5.

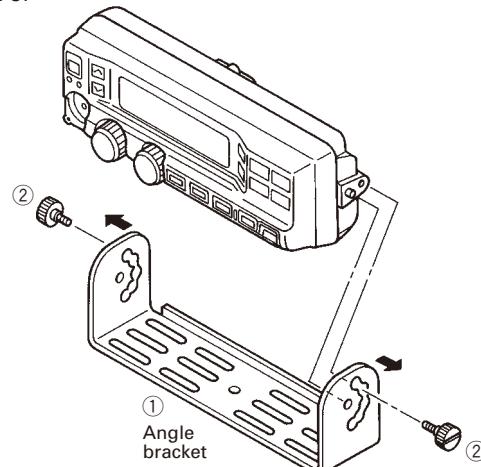

Fig. 2-4

INSTALLATION

3. Dual Control Head Remote Kit

(KRK-6DH: Option)

The KRK-6DH remote kit connects two displays (two KCH-14s or KCH-15s) to the transceiver. The KRK-6DH is connected to the KCH-14s or KCH-15s with two optional control cables. There are three version of the control cable: KCT-22M (8 feet), KCT-22M2 (17 feet), and KCT-22M3 (25 feet).

3-1. Installing the KRK-6DH main panel onto the transceiver

1. Remove the upper case and lower case of the transceiver.
2. Insert the lead wire with connector (W700) of the control unit (X53-440) into the connector (CN4) of the KRK-6DH. Insert the lead wire with connector (W104) of the KRK-6DH into the connector (CN503) of the transceiver.
3. Install the KRK-6DH main panel on the transceiver using four screws ①.

Note:

Take care that the lead wire with connector (W700) is not caught when fitting the KRK-6DH main panel on the transceiver.

4. Affixing the sheet (G11-4379-04) for the waterproof (Fig.3-1-2).
 - (1) Remove the covering paper of the sheet ②.
 - (2) Affix the sheet while taking note of the position of the three parts as shown in Fig.3-1-2 ③.
 - Firmly affix the sheet to the chassis by pushing the double-coated tape with your fingers.
 - (3) Repeat step (2) to affix the sheet to the other side of chassis.

Note:

The sheet cannot be reused. Affix a new sheet when you removed the sheet.

5. Reassemble the upper case and lower case of the transceiver. (Refer to page 18)

Note:

Take care that the sheet (G11-4379-04) is not peeled off when installing the upper/lower case.

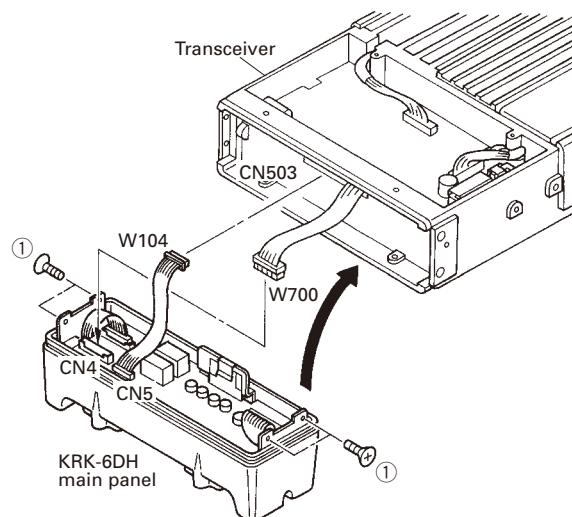

Fig. 3-1-1

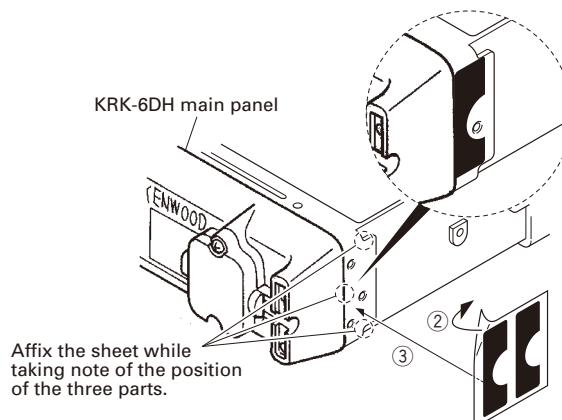

Fig. 3-1-2

3-2. Installing two KRK-6DH rear panels onto two front panel kits

Install each KRK-6DH rear panel onto each front panel kit as same as "2-2. Install the KRK-5 rear panel onto the front panel kit" described on page 10.

3-3. Control cable (KCT-22) connection (Fig. 3-2)

1. Use two control cables. Insert one connector of the one control cable to the transceiver (with KRK-6DH) and the other to the display 1. Insert one connector of the other control cable to the transceiver (with KRK-6DH) and the other to the display 2. Connect each cable to the GND terminal with the screws ① supplied with each control cable.
2. Secure the one connector of each control cable to the KRK-6DH main panel with two screws ② according to the installation condition of the transceiver. Pass the control cables through the grooves at both ends of the KRK-6DH main panel and secure the control cables to the KRK-6DH with the cable fitting (J21-4354-04) and two screws ③ supplied with the KRK-6DH.
3. Secure the other connectors of the control cables to the display 1 and display 2 with two screws ④ in the same way.

TK-5910(B)

INSTALLATION

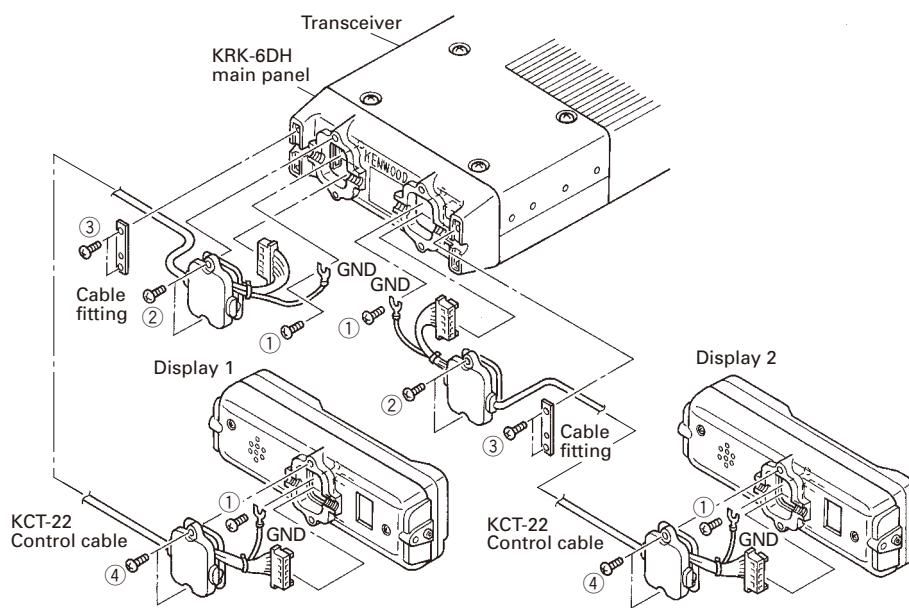

Fig. 3-2

4. Ignition Sense Cable (KCT-18: Option)

The KCT-18 is an optional cable to use the following functions:

- **Ignition function**

The ignition function allows you to turn the transceiver's power on and off with the ignition key of your car. When you are driving with the ignition key on, the horn alert function is disabled.

- **Timed power-off function**

The timed power-off function turns the transceiver's power off the time specified with the programming software (KPG-95D) after the ignition key is turned off. When you are driving with the ignition key on, the horn alert function is disabled.

The ignition sense function and the timed power-off function can be used at the same time.

4-1. Connecting the KCT-18 cable to the transceiver

1. Remove the short plug from the accessory connector (9-pin) on the rear of the transceiver.
2. Insert the KCT-18 lead terminal into pin 1 (IGN) of the short plug (9-pin).
3. Connect the short plug to the accessory connector (9-pin) on the rear of the transceiver.

Note:

You must setup using the KPG-95D.

4-2. Connecting the KCT-18 cable to the KRK-5/6DH remote kit

1. Remove the square plug from the accessory connector (12-pin) on the rear of the control head.
2. Cut off the end of the rubber cap (accessory), insert the KCT-18 lead terminal into the rubber cap, and insert it into pin 1 (IGN) of the square plug.

3. Connect the square plug and rubber cap to the accessory connector (12-pin) on the rear of the control head, then clamp the bottom of the rubber cap with the supplied tie wrap.

Note:

You must setup using the KPG-95D.

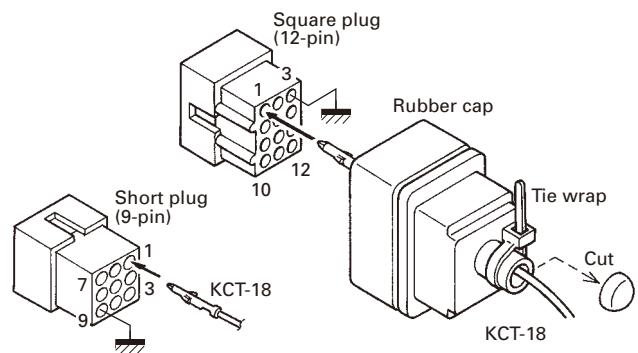

Fig. 4-1

Fig. 4-2

INSTALLATION

5. Voice Guide & Storage Unit (VGS-1: Option)

5-1. Installing the VGS-1 unit in the transceiver

1. Remove the upper case and upper packing of the transceiver.
2. Attach two cushions to the VGS-1 as shown in figure.

Note:

- Be sure not to cover the VGS-1 connector (CN1) with the cushion.
3. Insert the VGS-1 connector (CN1) into the control unit connector (CN411).

Note:

You must setup using the KPG-95D.

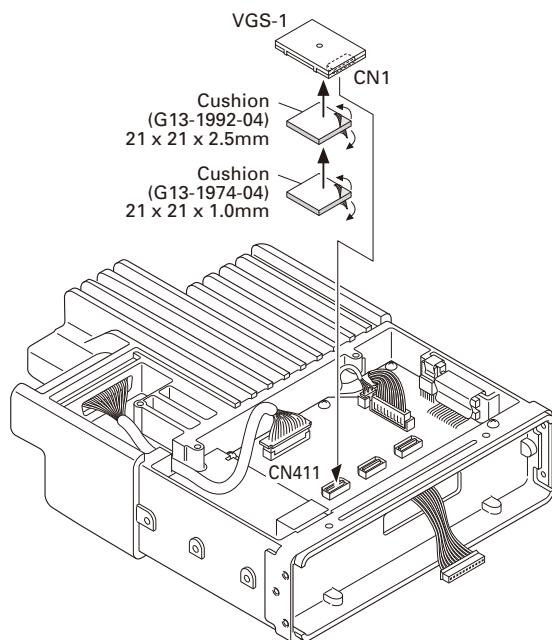

Fig. 5

6. External Speaker (KES-5: Option)

The speaker output from the transceiver is as follows:

1. The KCH-14 has a built-in speaker (3W/8 ohms).
2. The KCH-15 does not have a built-in speaker.
3. The external speaker output from the accessory connector (9-pin) on the rear of the transceiver is 13W/4 ohms. Use the KES-5.
4. The speaker output from the accessory connector (12-pin) on the rear of the control head is 2W/4 ohms. If the remote kit (KRK-5, KRK-6DH) is used, use the KES-5.

Note:

Since the transceiver uses a BTL audio amplifier, do not ground the speaker output pin.

6-1. Connecting the KES-5 external speaker to the transceiver

- When taking the AF output from the accessory connector (9-pin) on the rear of the transceiver

The following tools are required for changing the connector.

Extracting tool

The following extracting tool is recommended :
Molex Inc. Order No.: 11-03-0002

1. Remove the short plug from the accessory connector (9-pin) on the rear of the transceiver (Fig. 6-1-1).
Note: Save the jumper, which is required when the transceiver is used without the external speaker.
2. Remove the terminals with the jumper from the connector housing holes number 3 and 6 using the extracting tool.

Removing the jumper lead (Fig. 6-1-2)

- 1) Insert the extracting tool (11-03-0002) into the connector while pushing the jumper lead in the direction of (a).
- 2) Push the extracting tool into collapse the barbs of the crimp terminal.
- 3) Pull out the lead while continuing to push the extracting tool in the direction (b).
3. Reinsert the terminal with the black and white stripe lead into hole number 2, and the terminal with the black lead into hole number 6 (Fig. 6-1-3).
4. Connect the short plug to the accessory connector (9-pin) on the rear of the transceiver.

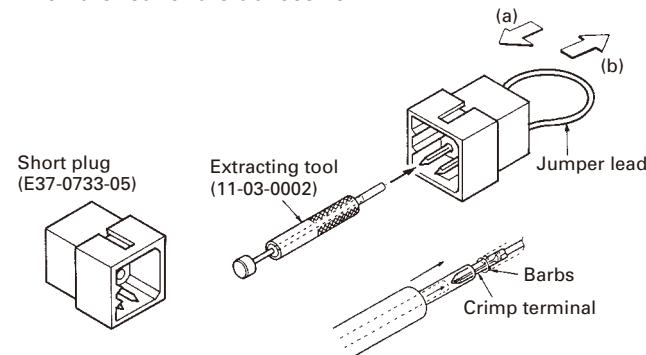

Fig. 6-1-1

Fig. 6-1-2

INSTALLATION

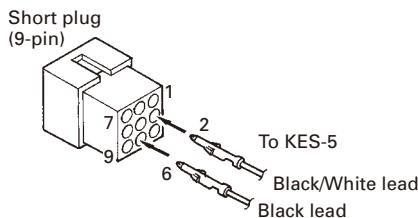

Fig. 6-1-3

6-2. Connecting the KES-5 external speaker to the KRK-5/6DH remote kit

- When taking the AF output from the 12-pin accessory connector on the rear of the control head
 - Modification of plug (12-pin)
1. Remove the square plug from the accessory connector (12-pin) on the rear of the control head.
 2. Cut off the end of the rubber cap, insert the KES-5 speaker cable into the cap, and insert it into pins 10 and 11 of the square plug.
 3. Connect the square plug and rubber cap to the accessory connector (12-pin) on the rear of the control head, then clamp the bottom of the rubber cap with the supplied tie wrap.

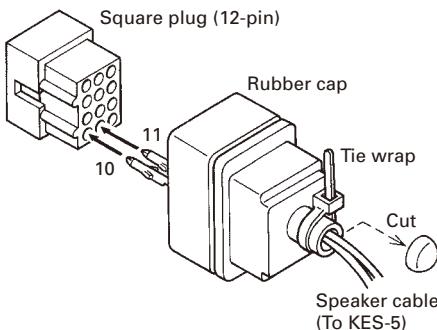

Fig. 6-2-1

• If the KCH-14 is used

If the KES-5 is connected to the 12-pin accessory connector, remove the internal speaker wire.

If the internal speaker is used, remove the wire connected to pins 10 and 11 of the 12-pin accessory connector.

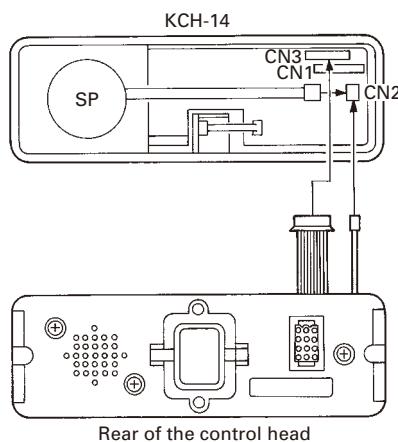

Fig. 6-2-2

6-3. Modification to increase the audio output of the control head

The speaker output can be increased to 13W by moving jumper resistor (0 ohm) R74 to \$R73 on the KCH-14 display unit (X54-349 A/3). In this case, the KCH-14 internal speaker cannot be used because the maximum input (3W) of the internal speaker is exceeded. Therefore, use the KES-5.

Note:

Even if the KRK-6DH is modified in this way, the audio output of head 2 cannot be increased.

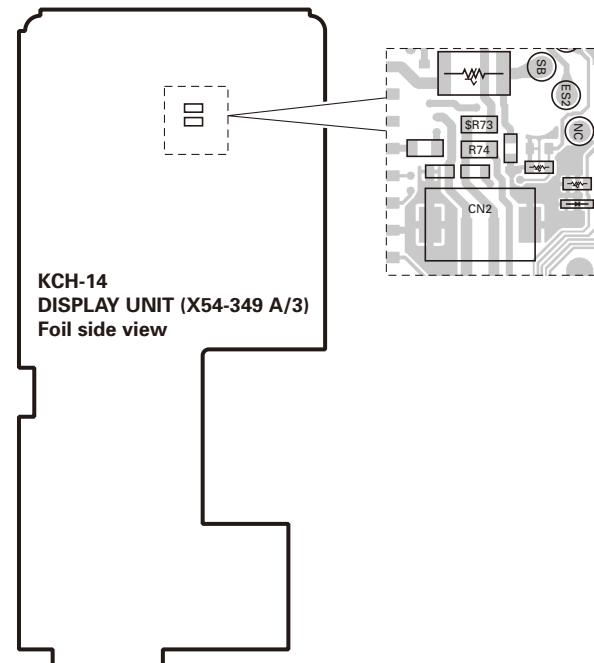

Fig. 6-3

6-4. Use as public address speaker

1. Remove the short plug from the 9-pin accessory connector on the rear of the transceiver. (Remove the jumper lead as described in Section 6-1 on page 13.)
2. Insert the KES-5 speaker leads into pins 7 and 8 of the short plug.
3. If you remove jumper shorting pins 3 and 6, the 20W PA (public address) voice signal is output from pins 7 and 8. (Only when the PA or SP switch is on.)
4. If you use the transceiver shorted with pins 3 and 6, the internal speaker is available (when the KCH-14 is used). The KCH-15 does not contain a speaker.

Note:

Relationship between accessory connector (9-pin) connection and speaker output.

When pins 3 and 6 are shorted; The 3W internal speaker is used (KCH-14 only).

When pins 3 and 6 are opened and is output from pins 7 and 8; The 20W external speaker is used.

INSTALLATION

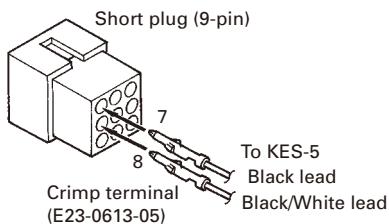

Fig. 6-4

7. Horn Alert Function

The HR1 and HR2 pins of the accessory connector (9-pin) on the rear of the transceiver are connected to the relay (K500) and the maximum current is 1A.

1. Remove the upper case of the transceiver.
2. To make the HR2 pin, remove the jumper resistor (0 ohm) R634 on the control unit (X53-440) as shown in Table 1.
3. Reassemble the PC board and the upper case.

	Default	Modification
R634	Present	Absent
State

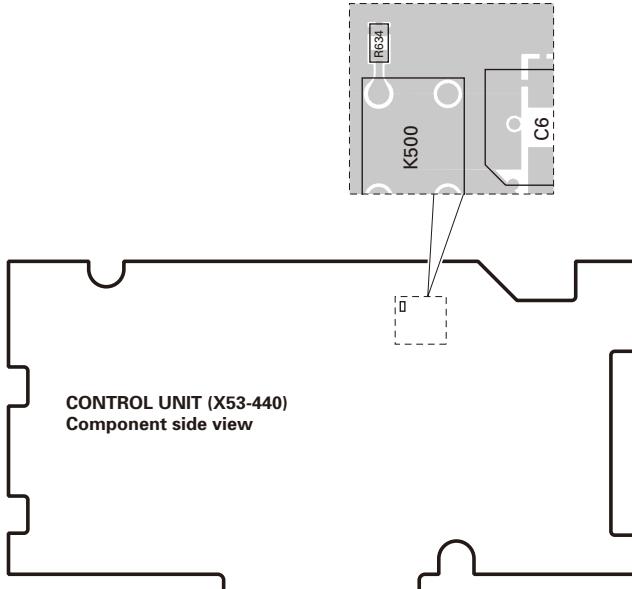

Fig. 7

8. Handheld control head

(KCH-16: Option)

The KCH-16 Handheld control head is used to remotely operate the transceive.

See the service manual No. B51-8834-00

9. AUX D-sub connector

To prevent the D-sub connector cable from detaching from the transceiver D-sub connector, the D-sub connector cable must have a screw-type locking mechanism to allow the use of a screwdriver to lock the D-sub connector.

Never use a D-sub connector with a hand-locking mechanism.

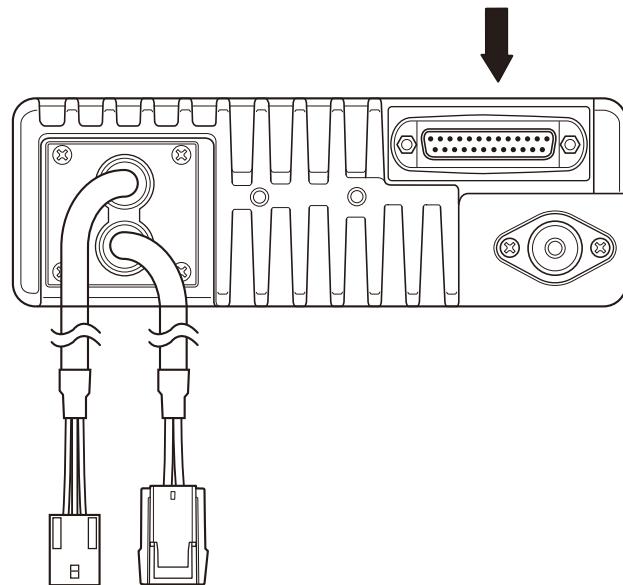

Fig. 8

DISASSEMBLY FOR REPAIR

Disassembly Procedure

■ Removing the upper/lower case and shield cover

1. Remove the 9 screws ① and 9 spacers ②.
2. Remove the upper case ③ and lower case ④.
3. Remove the upper packing ⑤ and lower packing ⑥.
4. Remove the shielding plate ⑦.
5. Remove the shielding plate ⑧.

■ Removing the TX-RX unit (X57-761)

1. Remove the 7 screws ⑨ holding the VCO shield cover.
2. Remove the VCO shield cover ⑩.
3. Remove the flat cable from the connector (CN600) of the TX-RX unit ⑫.

Note:

When re-installing the flat cable to the connector on the CN600 side, do not align the cable as shown in the figure 1, as there is a possibility of producing an effect on the sensitivity of P25.

Wrong

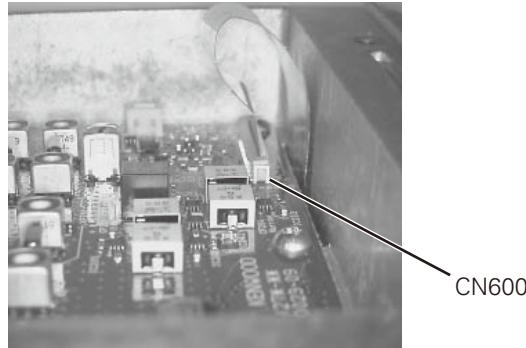

Fig. 1

Right

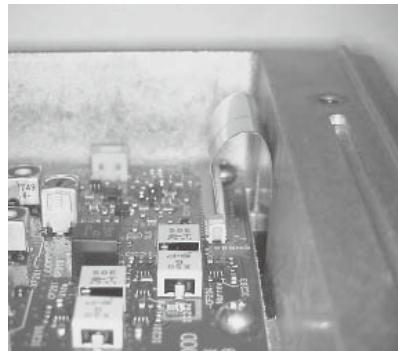

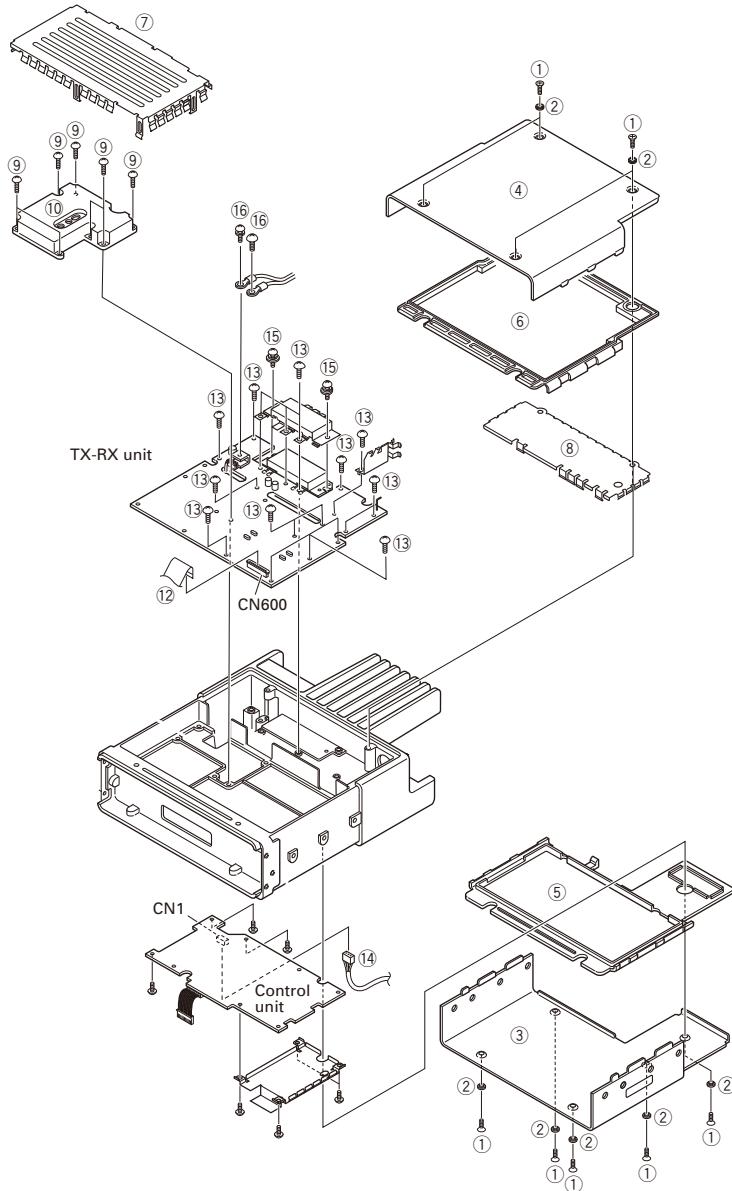

Fig. 2

4. Remove the 17 screws ⑬.
5. Remove the cables from the connector (CN1) of the control unit ⑭.
6. Remove the 2 screws ⑮ holding the power module.
7. Remove the solder of the power module with a solder absorber.
8. Remove the 2 screws ⑯ holding the + (positive) terminal and - (negative) terminal of the power supply cable.
9. Remove the solder of the antenna receptacle with a solder absorber.

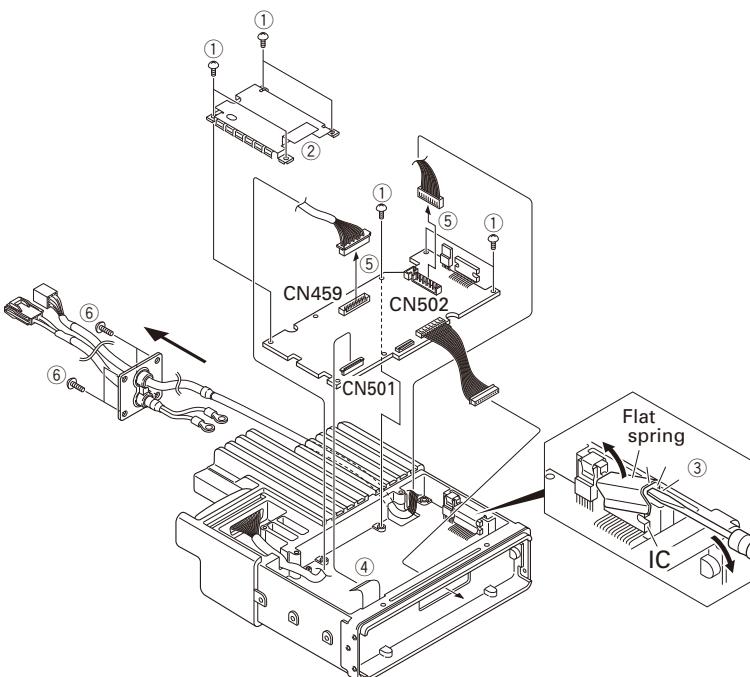

DISASSEMBLY FOR REPAIR

■ Removing the Control unit (X53-440)

1. Remove the 7 screws ①.
2. Remove the shield plate x.
3. With a flat-head screwdriver, remove the ② flat springs holding the ICs (IC5, IC522) ③.
4. Remove the flat cable from the connector (CN501) ④.
5. Remove the cables from the two connectors (CN459, CN502) ⑤.

■ Removing the accessory cable and power supply cable on the rear of the transceiver

1. Confirm the following contents.
 - The screws holding the + (positive) terminal and - (negative) terminal of the power supply cable is removed.
 - The cable from the connector (CN502) of the Control unit is removed.
2. Remove the 4 screws ⑥ on the rear of the transceiver.
3. Pull out the power supply cable and accessory cable.

Precautions for Reassembly

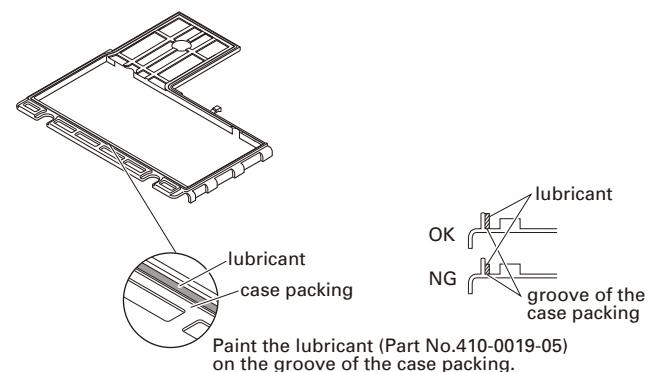

■ Painting the lubricant (Part No.: 410-0019-05) on the groove of the case packing

Paint the lubricant to the position as shown in figure after replacing or assembling the case packing.

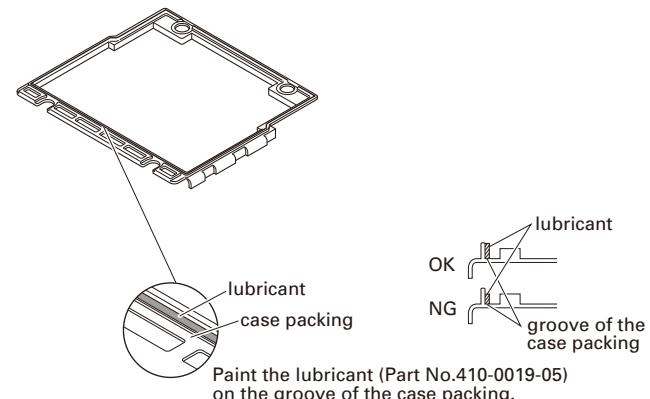

Note:

To assure waterproofing, paint the lubricant on the groove of the case packing.

- Case packing (Upper)

- Case packing (Lower)

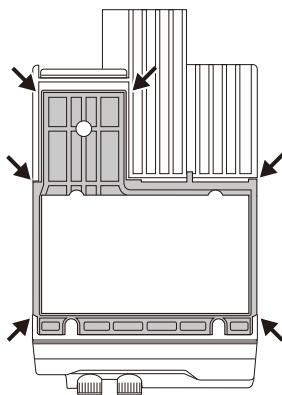

DISASSEMBLY FOR REPAIR

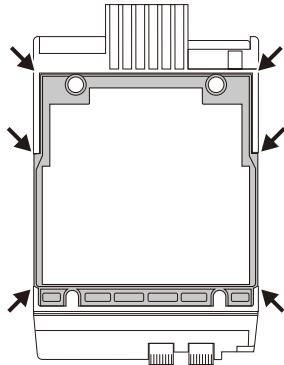

■ Procedures after installing the case packing to the chassis

After installing the case packing to the chassis, confirm that all corners of the upper/lower packing are securely fitted to the chassis. Place are shown in the arrow in the figure below.

- Case packing (Upper)

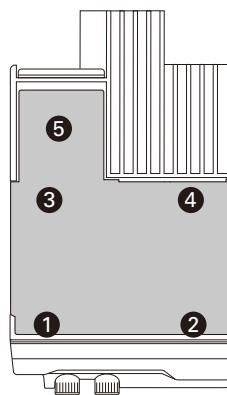

- Case packing (Lower)

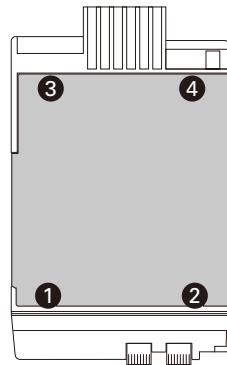

■ Sequence of tightening the screws for the upper/lower case to the chassis

Install the upper/lower case to the chassis and tighten the screws in the order shown in the figure below.

- Upper case

- Lower case

DISASSEMBLY FOR REPAIR

■ Precautions when tightening the screw of the + (positive) terminal of the power supply cable (red) to the +B terminal (CN14)

Tighten the screw using a regulated torque.

Note:

Please be careful not to tighten the screw so much that the terminal is warped.

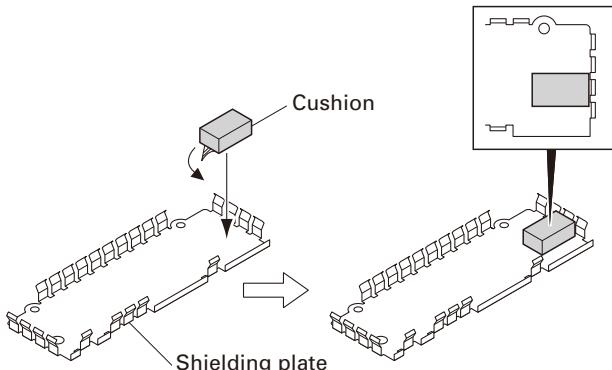

Installation Procedure during Parts Replacement

■ Attaching the new cushion (G13-2196-04) to the shielding plate (F10-1479-03)

1. Remove the release paper from the new cushion.
2. Attach the cushion as shown in the figure below.

Note:

The cushion cannot be reused. Attach a new cushion when you remove the cushion.

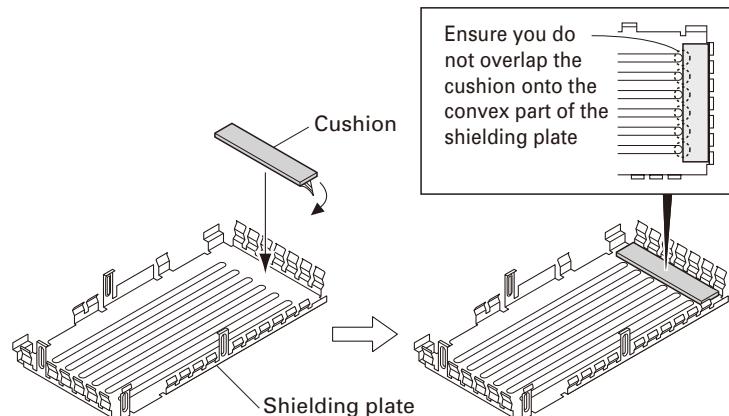

■ Attaching the new cushion (G13-2182-04) to the shielding plate

1. Remove the release paper from the new cushion.
2. Attach the cushion as shown in the figure below.

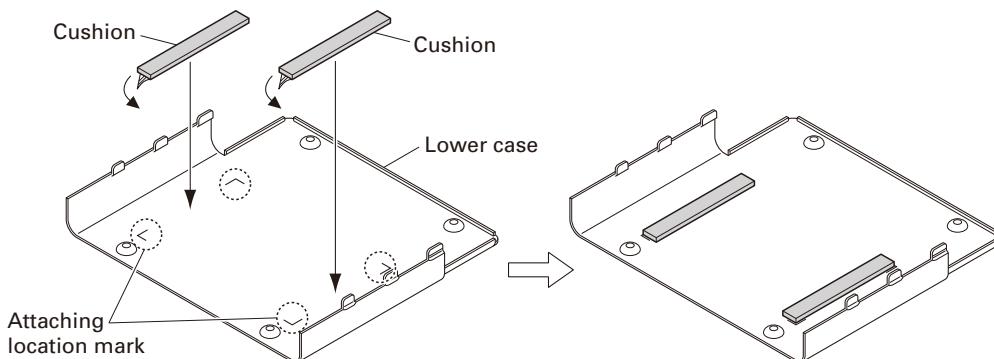

Note:

- Ensure you do not overlap the cushion onto the convex part of the shielding plate.
- The cushion cannot be reused. Attach a new cushion when you remove the cushion.

■ Attaching the two new cushions (G13-2195-04) to the lower case (A01-2162-32)

1. Remove the release paper from the two new cushions.
2. Attach the two cushions by aligning them with the attaching location marks which are stamped onto the lower case.

CIRCUIT DESCRIPTION

1. Overview

This transceiver is a 700M/800MHz FM & P25 mobile transceiver designed to operate in the frequency range of 763 to 775.99375MHz, 793 to 805.99375MHz (700M) and 806 to 825MHz, 851 to 870MHz (800M).

The unit consists of a receiver, a transmitter, a phase-locked loop (PLL) frequency synthesizer, a digital control unit, power supply circuit.

2. Frequency Configuration

The receiver is a double-conversion super heterodyne using first intermediate frequency (IF) of 73.05MHz and second IF of 450kHz. Incoming signals from the antenna are mixed with the local signal from the PLL circuit to produce the first IF of 73.05MHz.

This is then mixed with the 72.6MHz second local signal to produce the 450kHz second IF. This signal is detected to give the demodulated signal in the DSP.

The transmit signal frequency is generated by the PLL VCO, and modulated by the signal from the DSP. It is then amplified and fed to the antenna.

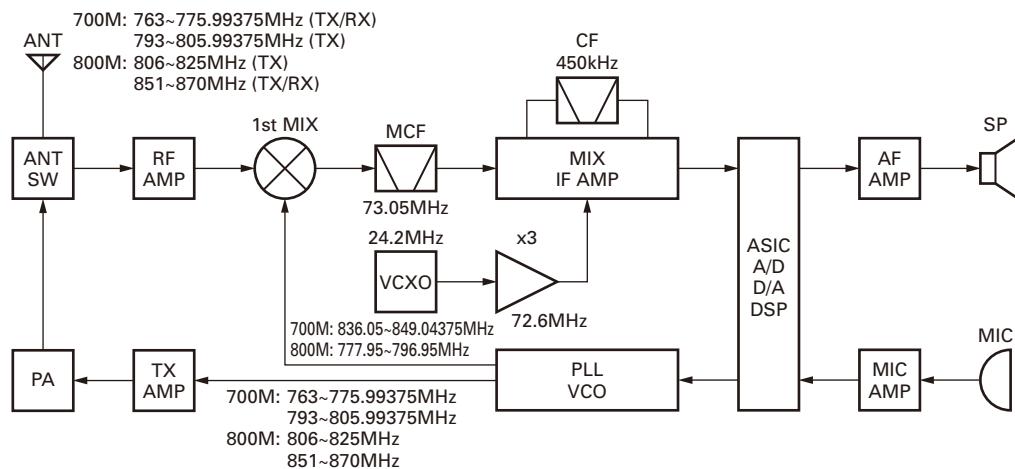

Fig. 1 Frequency configuration

3. Receiver System

3-1. Front-end RF Amplifier

The receive signal from antenna SW (D212, D213) is amplified by a RF amplifier (700MHz band: Q213, 800MHz band: Q214) and passes through the band-pass filter (700MHz band: L200, L201, 800MHz band: L202, L203) to remove unwanted signal, and these are controlled with the RF filter switch (D214, D215). Then the signal is fed to the 1st mixer.

3-2. 1st Mixer

The 1st mixer uses a silicon monolithic mixer (IC212). The 1st mixer mixes the signal with the 1st local oscillator frequency from the VCO, and converts it to the 1st IF (73.05MHz) (700M/Upper heterodyne, 800M/Lower heterodyne).

The signal then passes through monolithic crystal filter to remove unnecessary nearby frequency components. The signal from the MCF is used as the 1st IF signal.

The 1st IF section has two paths MCFs. Wide band is XF204 and Narrow band is XF202, and each band switched by D204, D205, D206, D207, D208, D209, D210 and D211.

3-3. IF Amplifier

The 1st IF signal is amplified by the IF amplifier (Q205) and fed into the FM IC (IC209). The IF signal is then mixed with the 2nd local oscillator frequency of 72.6MHz to generate the 2nd IF of 450kHz. The 450KHz signal is then passed through a ceramic filter (CF202, CF204) and fed back into IC209 for additional amplification.

CIRCUIT DESCRIPTION

3-4. Wide/Narrow/P25 Switching Circuit

Wide, Narrow, NPSPAC and P25 settings can be made for each channel by switching the ceramic filters CF201 and CF202 (Wide, NPSPAC), CF200 and CF204 (Narrow, P25), and there are controlled with the multiplexers (IC201, IC203, IC205, IC207).

When a $\overline{WN2}$ Signal line is H, the 450kHz signal is passed through a ceramic filter (Wide: CF201 and CF202).

When a $\overline{WN2}$ signal line is L, the 450kHz signal is passed through a ceramic filter (Narrow: CF200 and CF204).

After that, the signal is fed into ASIC (IC708) through ceramic filter (CF100). And then, the signal is demodulated in ASIC and the AF signal is dealing with DSP (IC701).

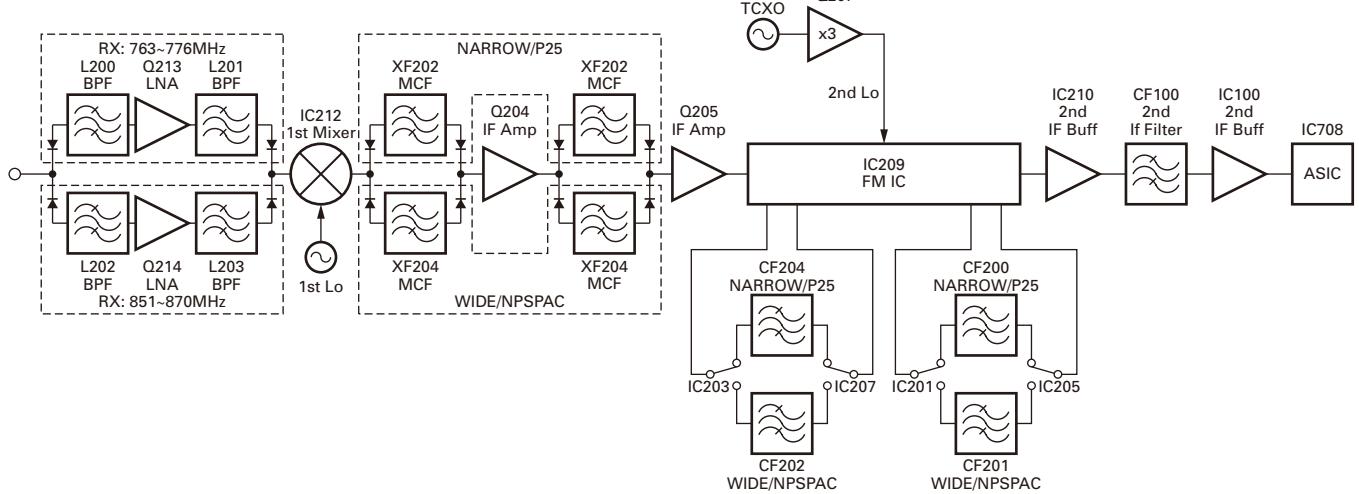

Fig. 2 RF and IF circuit

3-5. Audio Amplifier Circuit

Audio processing (high-pass filter, low-pass filter, deemphasized and so on) at FM mode and decoding at P25 mode are processed by DSP. Audio signal from IC708, IC701 goes through Low-pass filter (IC503). The signal then goes through mute switch (IC506), amplifier (IC510), and switch (IC515), and electronic volume control (IC517), and pre-amp

(IC516), and audio mute switch (Q506), and audio route switch (IC518), and audio power amp (IC522).

While busy, /SPK_MUTE becomes High, turn Mute switch (Q506) off, and signal is fed to AF Power Amp (IC522). While Non-busy, /SPK_MUTE is become Low, turn Mute switch (Q506) on, then there is not AF output.

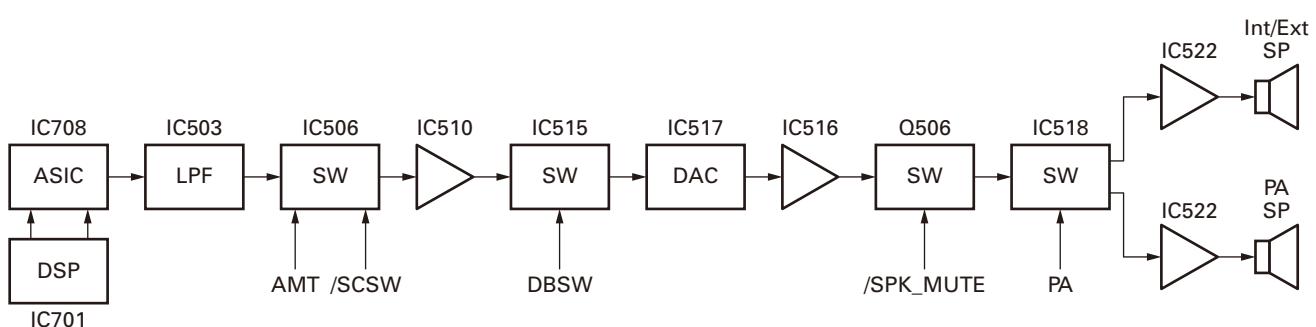

Fig. 3 Audio amplifier circuit

CIRCUIT DESCRIPTION

3-6. Squelch Circuit

It amplifies the demodulated noise signal from FM IC (IC209) after filtering through BPF circuit. Then, the amplified signal is converted to DC signal by the detection circuit. The converted signal is fed to the ASIC (IC708).

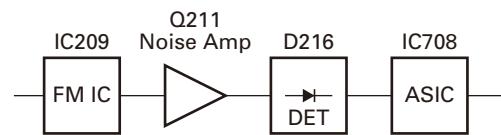

Fig. 4 Squelch circuit

4. Transmitter System

4-1. Audio Band Circuit

The signal from the microphone goes through the mute switch (Q503), the MIC-Mute signal (MM) becomes Low, and then mute switch (Q503) is turned off. The signal from microphone goes through summing-Amp (IC512) and MIC-AGC (IC512, Q501, Q502, D500, D501), and goes through audio route switch (IC509), and amplified by MIC-Amp IC505. LPF IC501 works as anti-aliasing filter.

4-2. Base Band Circuit

The audio signal output from the base band circuit is converted by ASIC (IC708) to digital data of a sampling

frequency of 48kHz. This digital data is sent to the DSP (IC701) and voice signals of 300Hz or lower and frequencies of 3kHz or higher are cut off and an audio range 300Hz to 3kHz is extracted. The audio signal is then pre-emphasized in FM mode and synthesized with the signals, such as QT and DQT, as required, and is then output from the ASIC (IC708). In P25 mode, the audio signal is converted to the C4FM base band signal and output from the ASIC (IC708). The DTMF base band signals are also generated by the DSP (IC701) and output by the ASIC (IC708).

LPF (IC514) works as smoothing filter. The DAC (IC517) assigns the base band signal to the VCO and VCXO (X400). At this time, the level output according to the transmit carrier is fine-adjusted according to each modulation method.

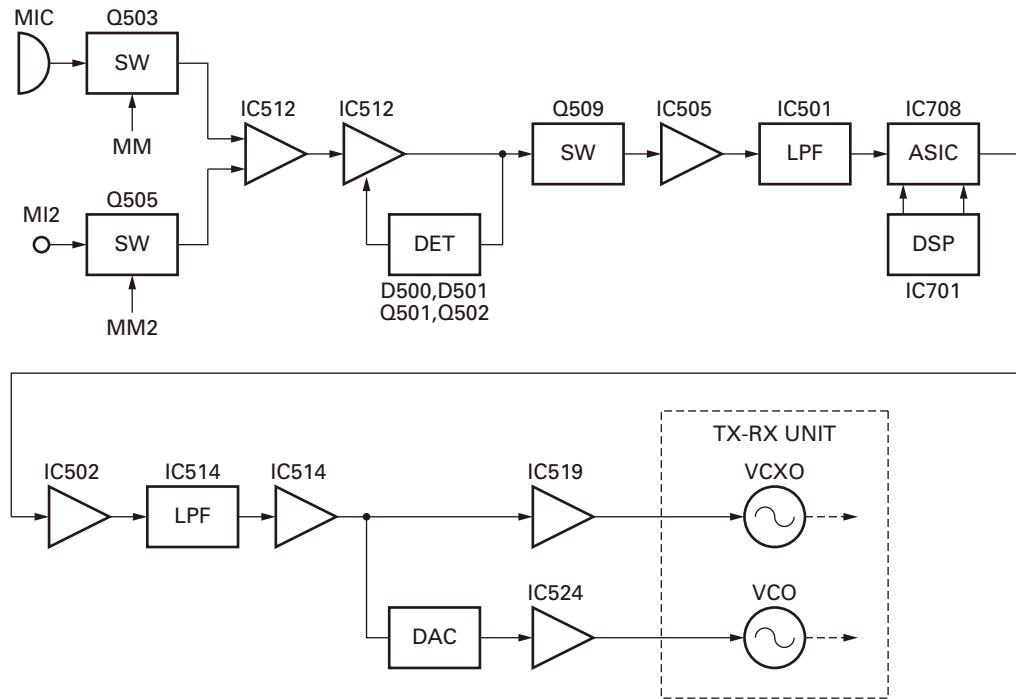

Fig. 5 Audio band and Base band circuit

CIRCUIT DESCRIPTION

4-3. Drive Amplifier and Power module Circuits

The transmission signal is passed through the T/R switch (D420) and is amplified by the two drive amplifiers (Q150, Q151). This amplified signal is passed through the attenuator and is amplified by the power module (IC2).

The output of the power module (IC2) is passed through the CM coupler, ANT SW and LPF, and then it is fed to the antenna terminal (CN10).

4-4. Automatic Power Control Circuit

The automatic power control (APC) circuit stabilizes the transmission output power at a predetermined level, and consists of forward/reflected power detector circuits.

Forward RF power is detected by D5, and is converted into DC voltage. The converted DC voltage is fed to the APC comparator (IC1), and is compared with the PC voltage, then

is output from APC comparator (IC1) as an APC voltage. The APC voltage controls the gate voltage of the Pre Drive Amp (Q150), Drive Amp (Q151) and Power module (IC2), and keeps transmission output stable.

If an abnormal antenna load is connected, reflected RF power is detected by D6, and output voltage is fed to the APC comparator (IC1). The transmission output is reduced more as this DC voltage rises.

4-5. Temperature Protection Circuit

The temperature protection circuit reduces the APC voltage when the temperature of IC2 rises, to prevent thermal destruction of the final amplifier (IC2). The ASIC (IC708) detects the temperature with a thermistor (TH4, TH5) to control the reference voltage to the APC circuit.

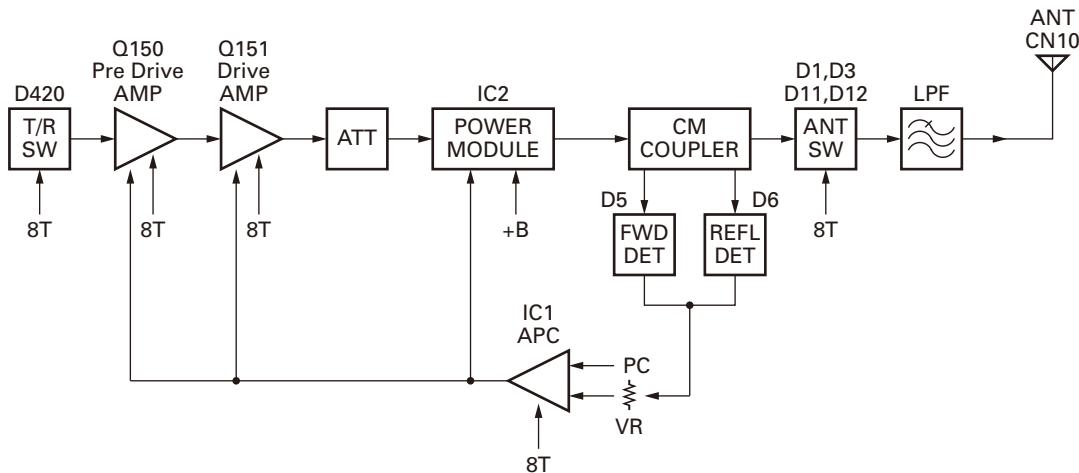

Fig. 6 Automatic power control circuit

5. PLL Frequency Synthesizer

The PLL Frequency Synthesizer consists of the following components:

- VCXO (X400)
- VCO (Q413, Q414, Q415)
- Potentiometer IC (IC401)
- PLL IC (IC400)
- Local Switch (D419, D420)

This PLL system is composed of a PLL-IC (IC400), a crystal oscillator (X400), VCO and a potentiometer (IC401).

VCO (Voltage Controlled Oscillator) is provided with 2 input terminals which are controlled by the potentiometer and by PLL.

The potentiometer brings the oscillation frequency of VCO close to the target frequency roughly, after that PLL locks it up.

The operation frequency of PLL is from 763 to 775.99375MHz, 793 to 805.99375MHz, 806 to 825MHz, 851 to 870MHz in TX mode and, from 777.95 to 796.95MHz, 836.05 to 849.04375MHz in RX mode.

The frequency step of PLL is 6.25kHz. The comparative frequency of PLL which is 100kHz is made by programmable reference divider in PLL-IC (IC400) from 24.2MHz reference signal of crystal oscillator (X400).

The VCO output signal is divided into comparative frequency by programmable N divider in PLL-IC (IC400) similarly, and is compared with the divided reference signal in a phase detector in it.

The output signal of the phase detector is put into one of the input terminals of VCO.

CIRCUIT DESCRIPTION

5-1. VCXO (X400)

VCXO (X400) generates a reference frequency of 24.2MHz for the PLL frequency synthesizer.

This reference frequency is applied to pin 10 of the PLL IC (IC400).

The VCXO oscillation frequency is fine-adjusted by controlling the voltage applied to pin 1 of the VCCO with ASIC (IC708). It is also controlled with pin of 1 of the VCXO if the output from VCXO is modulated.

5-2. Voltage Controlled Oscillator (VCO)

There are three VCOs (VCO1, VCO2, VCO3).

The VCO1 (Q415) and VCO3 (Q413) generate 1st local receive signal or transmit carrier.

The VCO1 oscillation frequency is 381 to 399MHz and the VCO3 oscillation frequency is 418 to 435MHz.

The VCO2 (Q414) generate transmit carrier. The VCO2 oscillation frequency is 396 to 418MHz.

The VCO oscillation frequency is determined by two systems of operation switching terminals "STR" and "VCO1/2" and two systems of voltage control terminals "CV" and "ASSIST".

The operation switching terminals, "STR" and "VCO1/2", are controlled by the control lines (STR, VCO1/2) output from the ASIC (IC708). When the STR logic is high and the VCO1/2 logic is high, the VCO 1 output a 1st local receive signal or transmit carrier. When the STR logic is high and the VCO1/2 logic is low, the VCO 2 output a transmit carrier. When the STR logic is low, the VCO3 output a 1st local receive signal or a transmit carrier.

The voltage control terminals, "CV" and "ASSIST", are controlled by the PLL IC (IC400) and potentiometer IC (IC401) and the output frequency changes continuously according to the applied voltage.

For the modulation input terminal, "MOD", the output frequency changes according to the applied voltage. The oscillation frequency is controlled by the voltage of the input terminals of the VCO, obtained from the potentiometer IC applying to varactor diodes (D416, D417, D421, D411, D412, D422, D405, D406, and D407), and from the phase detector applying to varactor diodes (D413, D414, D408, D409, D402, and D403).

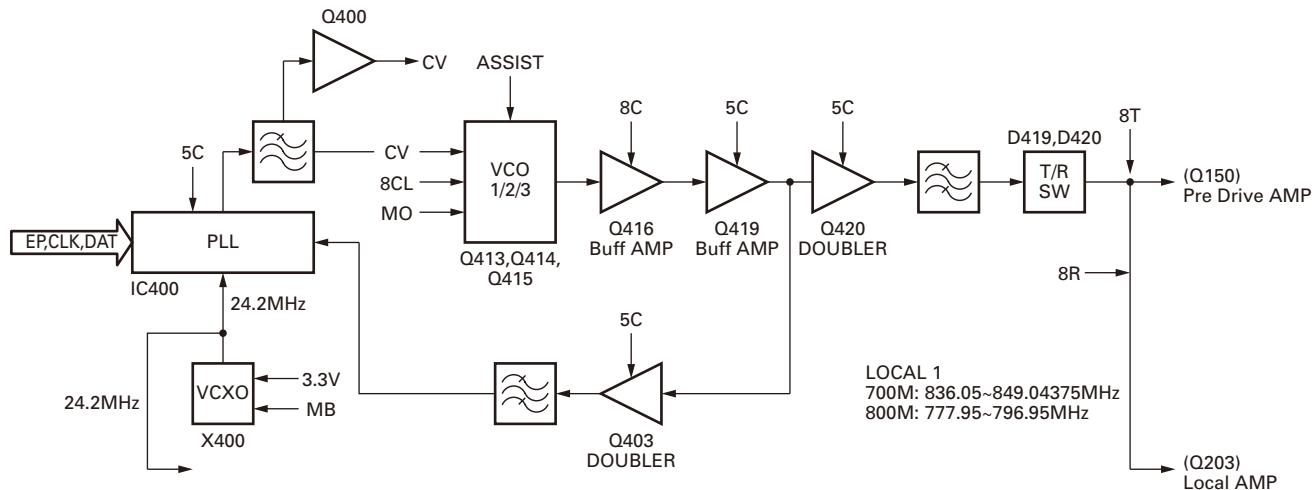

Fig. 7 System of PLL and VCO

CIRCUIT DESCRIPTION

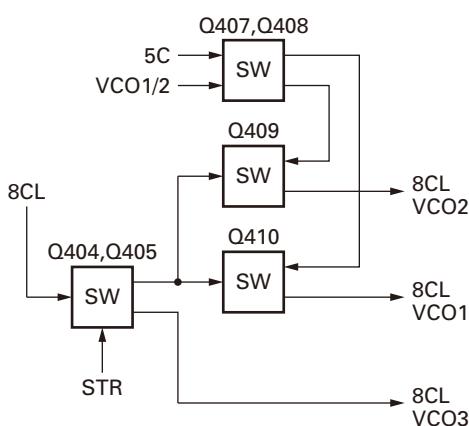

Fig. 8 Operation of voltage control circuit for VCO

5-3. Potentiometer IC (IC401)

The potentiometer IC (IC401) is connected to the VCO voltage control terminal, "ASSIST", and quickly controls the VCO oscillation frequency. However, its accuracy is low and the VCO frequency cannot be matched accurately with the desired transmit carrier or the 1st local receive signal.

The potentiometer IC is controlled by the ASIC (IC708) through the 3-line "PCS", "DAT", "CLK" serial bus.

5-4. Lockup Accelerator

The lockup accelerator is a circuit composed of a potentiometer IC (IC401) and a DC amplifier (IC403) to compel the oscillation frequency of the VCO to be close to the target.

The potentiometer IC outputs the voltage which meets the target frequency, and the signal is connected to one of two input terminals of the VCO through the DC amplifier.

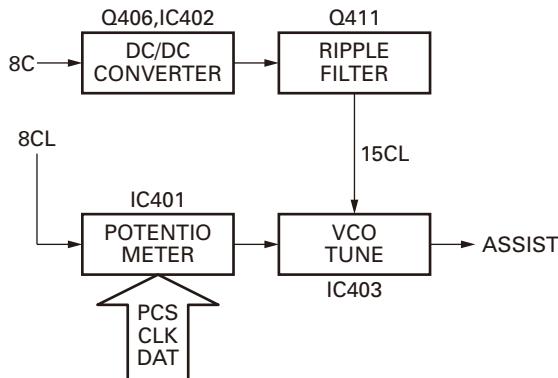

Fig.9 Lockup accelerator

5-5. PLL IC (IC400)

PLL IC compares the differences in phases of the VCO oscillation frequency and the VCXO reference frequency, returns the difference to the VCO CV terminal and realizes the "Phase Locked Loop" for the return control.

This allows the VCO oscillation frequency to accurately match (lock) the desired frequency.

When the frequency is controlled by the PLL, the frequency convergence time increases as the frequency difference increases when the set frequency is changed.

To supplement this, the potentiometer IC is used before control by the PLL IC to bring the VCO oscillation frequency close to the desired frequency. As a result, the VCO CV voltage does not change and is always stable at approximately 2V.

The desired frequency is set for the PLL IC by the ASIC (IC708) through the 3-line "EP", "DAT", "CLK" serial bus.

Whether the PLL IC is locked or not is monitored by the ASIC through the "UL" signal line.

When the "UL" logic is low, the VCO is not the desired frequency (unlock),

5-6. Local Switch (D419, D420)

The connection destination of the signal output from the amplifier (Q420) is changed with the diode switch (D420) that is controlled by the transmission power supply, 8T, and the diode switch (D419) that is controlled by the receive power supply, 8R.

When the 8T logic is high, it is connected to a transmit-area pre-drive amplifier (Q150).

When the 8R logic is high, it passes through the local amplifier (Q203) and connected to a receive-area mixer (IC212).

CIRCUIT DESCRIPTION

6. Control Circuit

The control circuit consists of the ASIC (IC708) and its peripheral circuits. IC708 performs the following;

- 1) Switching between transmission and reception by PTT signal input.
- 2) Reading system, zone, frequency, and program data from the memory circuit.
- 3) Sending frequency program data to the PLL.
- 4) Controlling squelch on/off by the DC voltage from the squelch circuit.
- 5) Controlling the audio mute circuit by decode data input.

6-1. ASIC

The ASIC (IC708) is 32bit RISC processor, equipped with peripheral function and ADC/DAC.

This ASIC operates at 18.432MHz clock and 3.3V/1.5V DC. It controls the flash memory, SRAM, DSP, the receive circuit, the transmitter circuit, the control circuit, and transfers data to or from an external device.

6-2. Memory Circuit

Memory circuit consists of the ASIC (IC708) and the SRAM (IC703), the flash memory (IC700). The flash memory has capacity of 64M-bit that contains the transceiver control program for the ASIC and stores the data. It also stores the data for transceiver channels and operating parameter that are written by the FPU. This program can be easily written from external devices. The SRAM has capacity of 2M-bit that contains work area and data area.

■ Flash memory

The flash memory stores the data that is written by the FPU (KPG-95D), tuning data (Deviation, Squelch, etc.), and firmware program (User mode, Test mode, Tuning mode, etc.).

■ SRAM (static memory)

The SRAM has temporary data area and work area.

When the power supply is off, it is backed up by an internal secondary lithium battery. Therefore, the save data does not break.

■ Real-time clock

The clock function is based on real-time clock IC (IC704). When the power supply is off, it is backed up by an internal secondary lithium battery.

6-3. Display Unit (KCH-14/15/16)

The display unit is composed of the CPU and the LCD & Key backlight etc.

6-4. Temperature Detection Circuit

The temperature detection circuit detects the temperature using a temperature IC (IC702) and corrects the thermal characteristic change of the receiver and transmitter adjustments.

6-5. DSP

The DSP circuit consists of a DSP (IC701) and processes the base band signal. The DSP operates on an external clock of 18.432MHz (the same as the IC708), the I/O section operates at 3.3V and the core section operates at 1.5V. The DSP carries out the following processes:

- C4FM processing
- Analog FM pre-emphasis/de-emphasis
- Vocoder processing between audio codec and modulation/demodulation
- CAI processing, such as error correction encoding
- QT/DQT encoding/decoding
- DTMF encoding
- Compressor/expander processing
- Transmit/receive audio filtering processing
- Microphone amplifier AGC processing
- Audio mute processing
- Modulation level processing

7. Power Supply Circuit

+B is connected to Final amplifier and DC/DC converter IC (IC4). IC4 regulates +B voltage to 5.0V (5M). 5M operates whenever +B is supplied. IC2 (33M), IC7 (33A) and IC8 (15M) are enabled while the 5M are operating. 33M, 33A and 15M provide the power to ASIC, DSP, and Flash memory. At this time ASIC starts working. Voltage detector IC (IC1) watches +B voltage. If +B voltage is higher than 8.6V, IC1 (V/BINT) outputs High. If the /BINT signal is high, Q3 (SB SW) is turned on by SBC signal from ASIC. (High: SB=ON, Low: SB=OFF). When the SB is turned on, IC5 (8C), IC3 (5C), IC9 (33GPS) start working. Q5 and Q10 and Q11 are controlled by SBC signal. If the SBC signal becomes High, Q5 (33M2) operates and Q10 (33AC) operates and Q11 (5MC SW) are turned on. The ASIC controls 8TC to High during transmission to supply power (8T) for transmission circuit. The ASIC controls 8RC to High during reception to supply power (8R) for reception circuit. When the ASIC detects the PSW (Power switch) signal, IGN (Ignition sense) signal or /BINT signal, it controls the SBC signal to Low, and turns the transceiver power (SB) off. When D1 and Q1 detect over-voltage condition, they turns Q3 (SB SW) off. But the ASIC still works.

If +B is not provided to the transceiver, the power is provided to SRAM and RTC through the secondary battery connected with CN4.

D7	Diode	Logic control switch (SBC)

COMPONENTS DESCRIPTION

Ref. No.	Part Name	Description
D8	Diode	DC/DC converter boost diode
D10,11	Diode	Reverse current prevention (33BU)
D400~405	Diode	Surge absorption (D-sub connector)
D406~409	Diode	Logic level converter (GPS data)
D410,429,430	Zener diode	Surge absorption (D-sub connector)
D411,412	Varistor	Surge absorption (D-sub connector)
D413~421	Diode	Surge absorption (D-sub connector)
D422,423	Varistor	Surge absorption (D-sub connector)
D424,425	Diode	Surge absorption (D-sub connector)
D426~428	Zener diode	Surge absorption (D-sub connector)
D500,501	Diode	AGC detection
D502	Zener diode	Surge absorption (D-sub connector)
D503	Diode	Surge absorption (D-sub connector)
D504,505	Varistor	Surge absorption (Display unit)
D506	Varistor	Over current protection (Display unit)
D507,508	Varistor	Surge absorption (Display unit)
D509	Diode	Discharge switch (ASQ)
D510	Varistor	Surge absorption (Display unit)
D512	Diode	Voltage protection (MB)

Ref. No.	Part Name	Description
Q208	Transistor	DC switch
Q209	Transistor	DC switch
Q210	FET	DC switch
Q211	Transistor	Noise AMP
Q213,214	FET	RF AMP
Q400	FET	CV detection
Q403	Transistor	Doubler AMP
Q404	Transistor	DC switch
Q405	FET	DC switch
Q406	FET	DC/DC
Q407	Transistor	DC switch
Q408	FET	DC switch
Q409,410	Transistor	DC switch
Q411,412	Transistor	Ripple filter
Q413~415	FET	VCO oscillator
Q416,419	Transistor	Buffer AMP
Q420	Transistor	Doubler AMP
Q600~603	Transistor	DC switch
Q605~607	FET	DC switch
D1	Diode	ANT switch
D2	Zener diode	Protect of voltage
D3	Diode	ANT switch
D5	Diode	Forward wave rectification
D6	Diode	Reflected wave rectification
D10	Diode	Combiner
D11,12	Diode	ANT switch
D13	Surge absorber	Surge absorption
D14	Diode	Protect of reverse connection
D15,16	Diode	ANT switch
D17	Surge absorber	Surge absorption
D204~211	Diode	IF switch
D212~215	Diode	700/800M switch
D216,217	Diode	Noise detector
D400	Diode	Ripple filter
D401	Diode	Assist DC
D402,403	Variable capacitance diode	VCO control
D405~409	Variable capacitance diode	VCO control
D411~414	Variable capacitance diode	VCO control
D416~418	Variable capacitance diode	VCO control
D419,420	Diode	TX/RX switch
D421~424	Variable capacitance diode	VCO control

TX-RX unit (X57-7610-10)

Ref. No.	Part Name	Description
IC1	IC	DC AMP and APC comparator
IC2	IC	Power module
IC201,203	IC	IF Filter switch
IC205,207	IC	IF Filter switch
IC209	IC	FM IC
IC210	IC	Buffer
IC211	IC	Multiplexer
IC212	IC	Mixer
IC213	IC	Voltage regulator (3.3V)
IC400	IC	PLL IC
IC401	IC	Potentiometer
IC402	IC	DC/DC
IC403	IC	VCO tune
IC404	IC	UL detection
IC600	IC	Shift register
IC601	IC	Voltage regulator (5V)
IC602,603	IC	Audio switch
Q150	FET	TX pre-drive AMP
Q151	FET	TX drive AMP
Q201,202	Transistor	DC switch
Q203	Transistor	RF AMP
Q204,205	Transistor	IF AMP
Q207	Transistor	Tripler AMP

If a part reference number is listed in a shaded box, that part does not come with the PCB.

TK-5910(B)

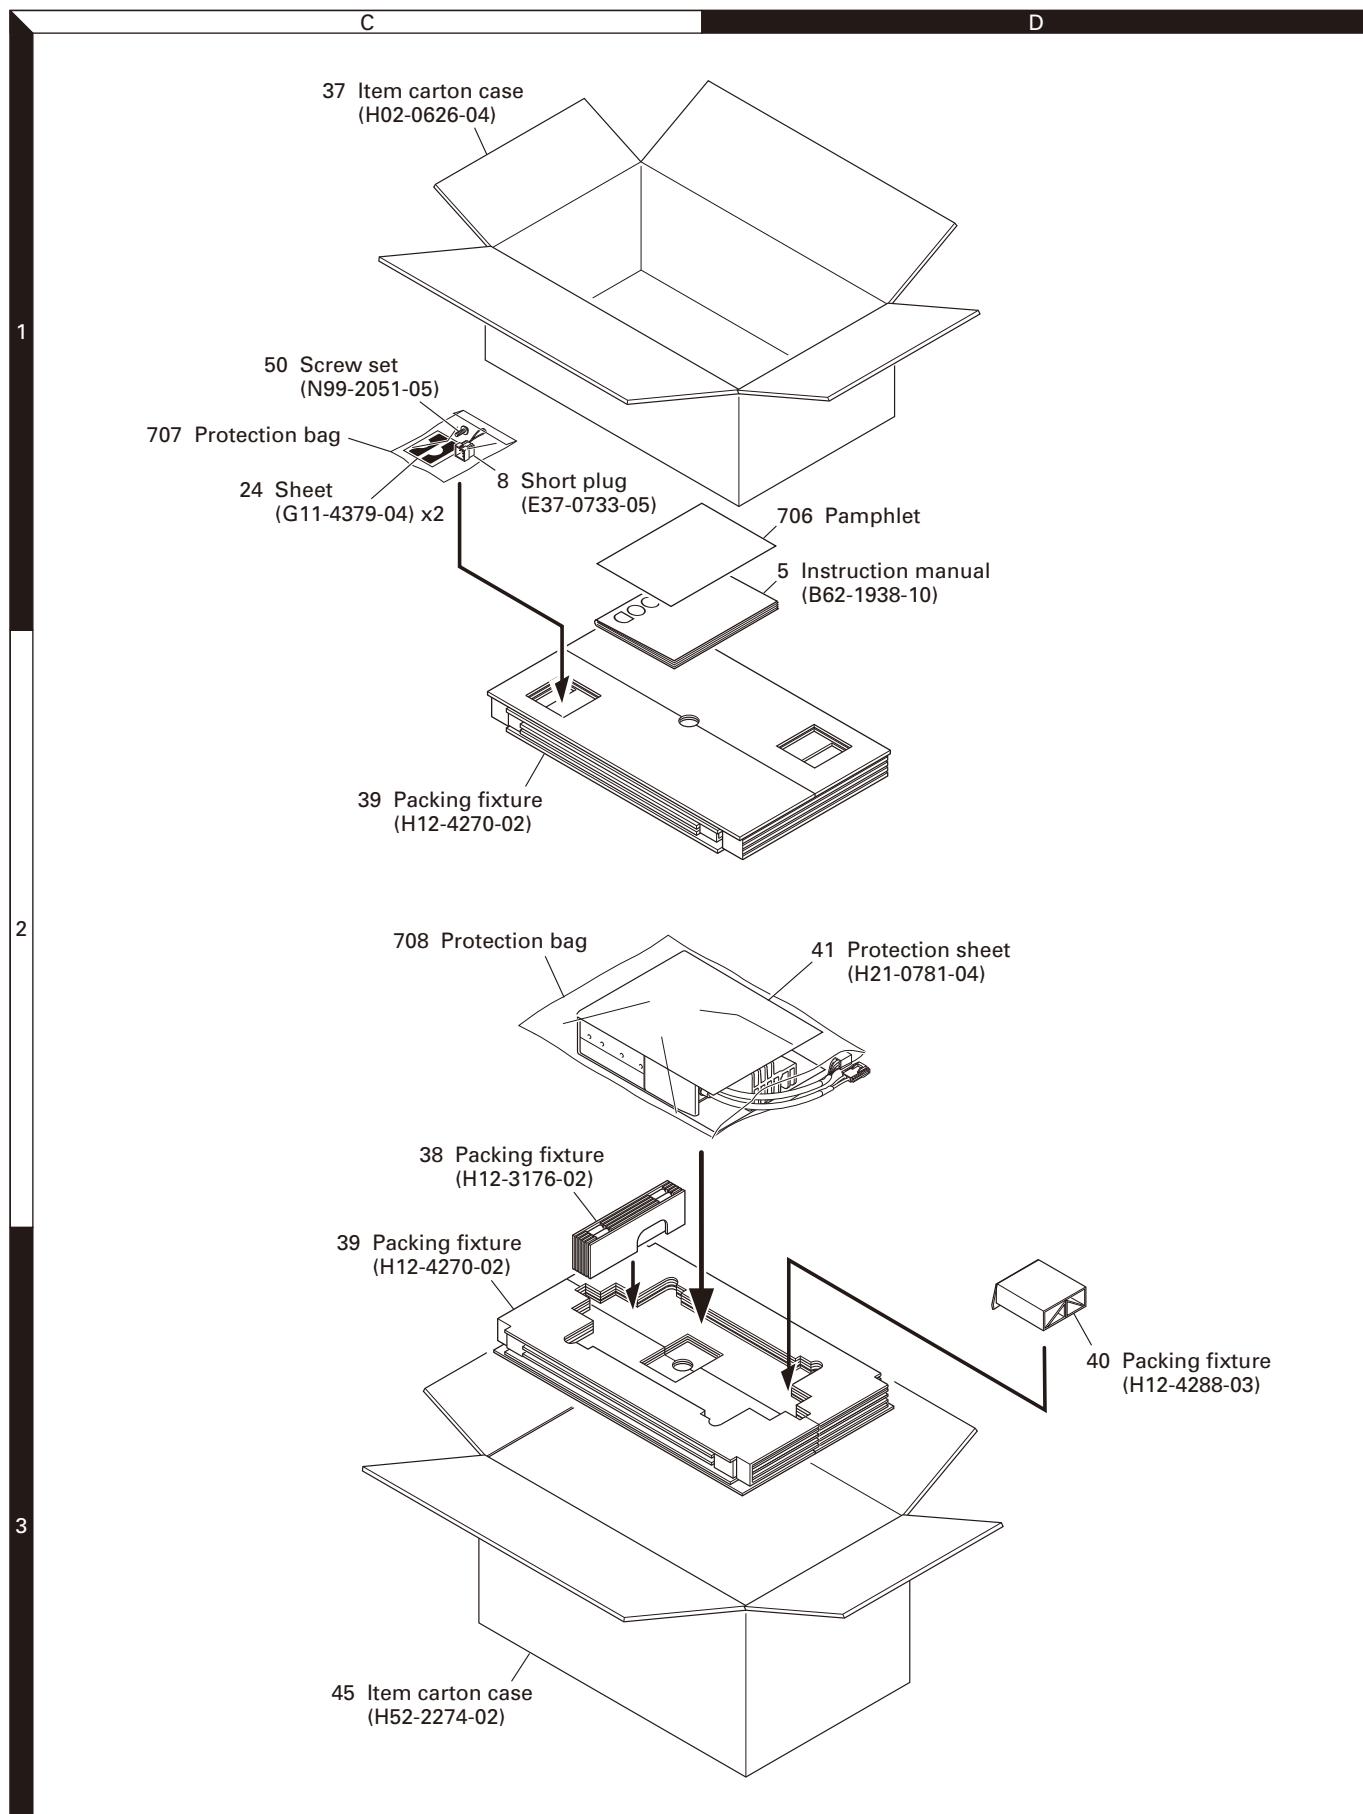

EXPLODED VIEW

Parts with the exploded numbers larger than 700 are not supplied.

If a part reference number is listed in a box on the exploded view of the PCB, that part does not come with the PCB. These parts must be ordered separately.

PACKING

Parts with the exploded numbers larger than 700 are not supplied.

TROUBLE SHOOTING

Fault diagnosis of the BGA (Ball Grid Array) IC

■ Overview

A flowchart for determining whether or not the transceiver can be powered on (the LCD does not function even if the power switch is turned on) due to broken BGA parts.

■ BGA parts

ASIC (IC708), DSP (IC701), FLASH (IC700), SRAM (IC703)

● Checking power supply voltage

Checking voltage	
Points to be checked	Normal voltage
33M IC2 (5 pin)	3.3V
15M IC8 (5 pin)	1.5V
33A IC7 (5 pin)	3.3V
33BU Q7 (Collector)	3.3V
Power supply of each device is connected through the ferrite bead. [ASIC] 33M: L708, 15M: L709 [DSP] 33M: L702, 15M: L701 [FLASH] 33M: L700 [SRAM] 33BU: L703	

When an abnormal value is confirmed:

Checking for an abnormal point

33M has an abnormal voltage.
[ASIC]
Remove L708 to check the voltage of the 33M.
If the voltage becomes normal, the ASIC is broken.
[DSP]
Remove L702 to check the voltage of the 33M.
If the voltage becomes normal, the DSP is broken.

[FLASH]
Remove L700 to check the voltage of the 33M.
If the voltage becomes normal, the FLASH is broken.

15M has an abnormal voltage.
[ASIC]
Remove L709 to check the voltage of the 15M.
If the voltage becomes normal, the ASIC is broken.
[DSP]
Remove L701 to check the voltage of the 15M.
If the voltage becomes normal, the DSP is broken.

33A has an abnormal voltage.
[ASIC]
Exchange IC7 (33A Regulator) to check the voltage of the 33A.If the voltage becomes normal, the ASIC is broken.

33BU has an abnormal voltage.
[SRAM]
Remove L703 to check the voltage of the 33BU.
If the voltage becomes normal, the SRAM is broken.

If the voltage is not corrected, there is a problem other than the BGA parts.

Remove the R764 and R713. If it oscillates normally, the DSP and ASIC may be broken.
Exchange IC704 (RTC).If it oscillates normally, the ASIC may be broken.

The BGA parts are not broken.

● Checking the clock

Checking the clock	
Points to be checked	Normal voltage (3.3V)
18.432MHz ASIC side R764	18.432MHz
DSP side R713	18.432MHz
32.768kHz IC704 (1 pin)	32.768kHz

When an abnormal value is confirmed:

● Checking the Reset/Control signal

Checking the control signal input to the ASIC	
Points to be checked	Normal voltage
RESET IC705 (4 pin)	3.3V
/BINT IC1 (1 pin)	3.3V
/OVRB D3 (Cathode side)	3.3V

When an abnormal value is confirmed:

Checking the ASIC input switch signal

*Each signal is not masked by the setting of the FPU.
The POWER key is pressed and held.

Points to be checked	Confirmed voltage
/PSW Q201 (Drain)	0V
The ignition key is kept ON.	Confirmed voltage 0V

When a normal value is confirmed:

Points to be checked
/FRST TP991

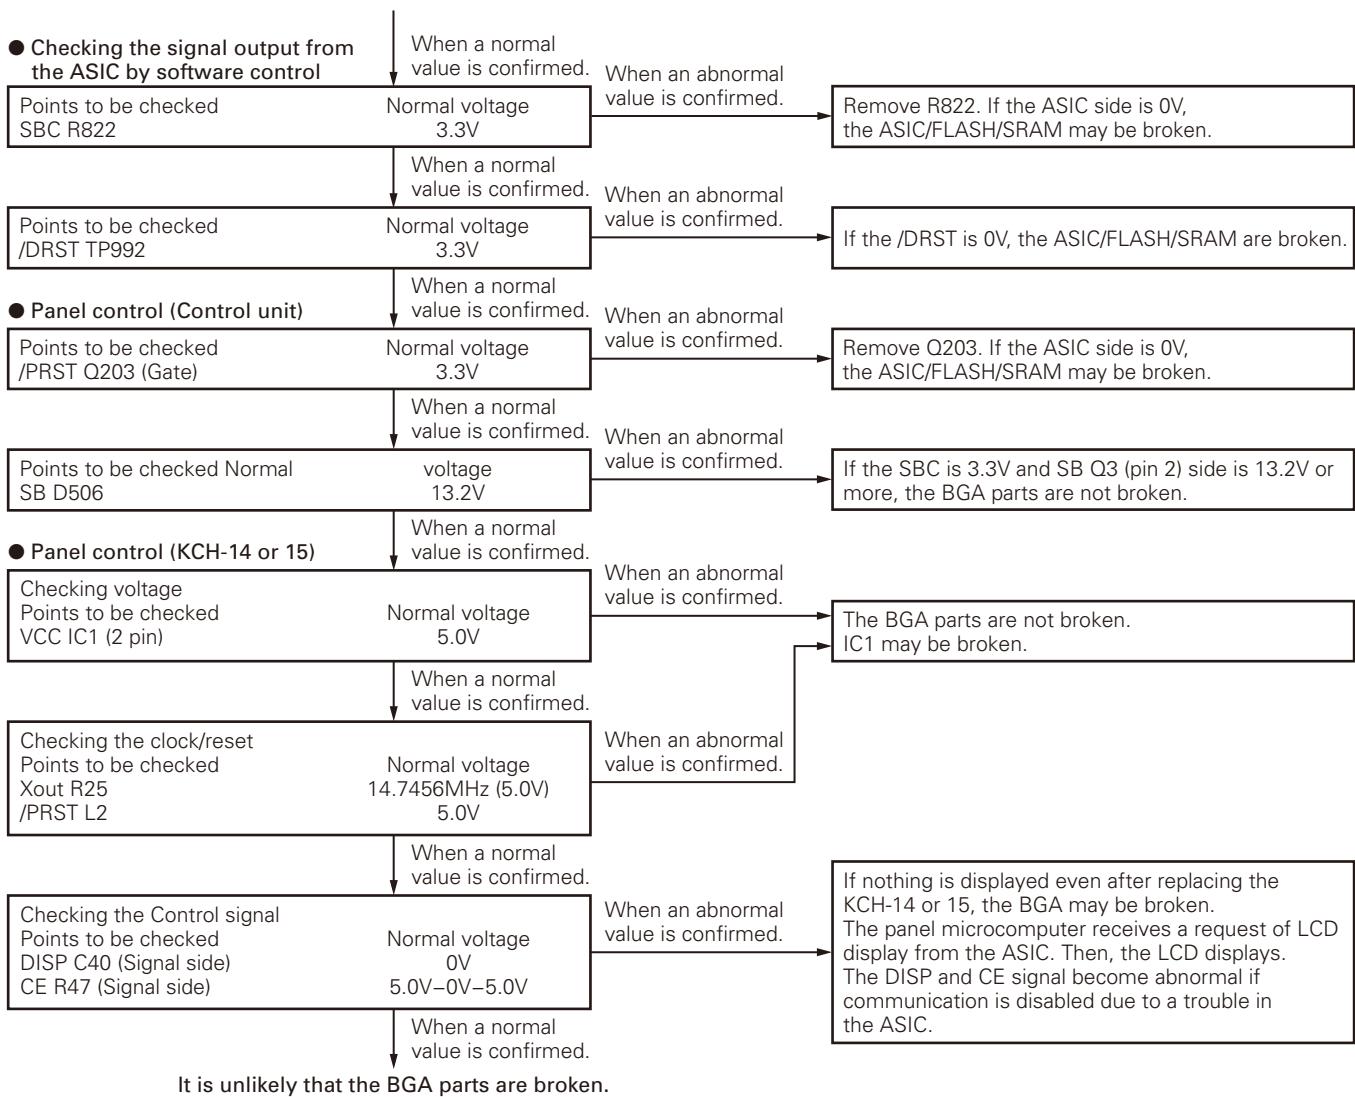

Points to be checked	Normal voltage
/FRST TP991	3.3V

When an abnormal value is confirmed:

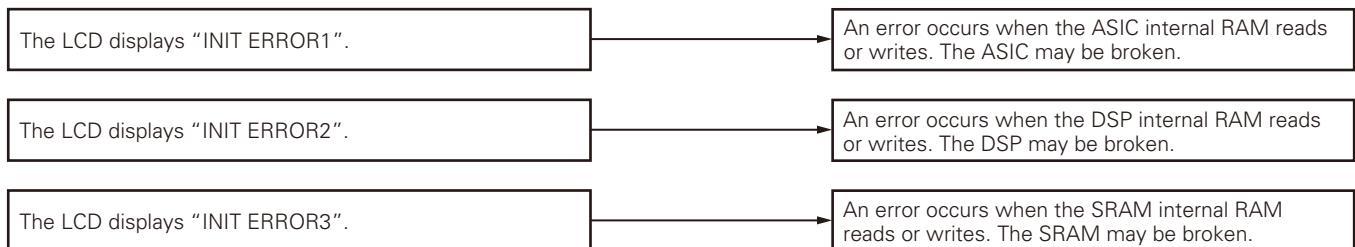

If the /FRST is always 0V, the ASIC is broken.

If the /FRST repeats 3.3V and 0V at intervals, the ASIC, FLASH and SRAM may be broken.

TROUBLE SHOOTING

● When an error display appears on the LCD.

Replacing Control Unit

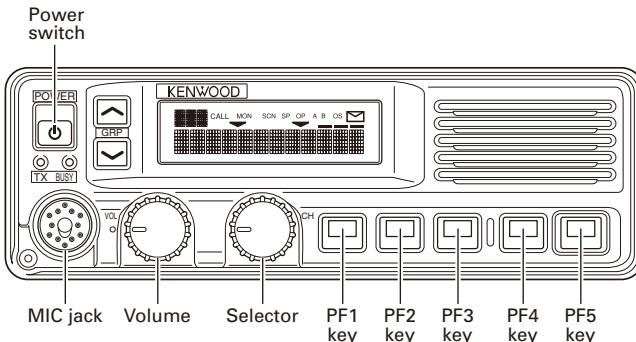

■ Control unit Information

Model Name	Original Control unit Number	For Service Control unit Number

Panel Test Mode

■ Test mode operation features

This transceiver has a test mode. To enter test mode, press and hold the [PF1] key while turning the transceiver power ON. Test mode can be inhibited by programming. To exit test mode, turn the transceiver power OFF.

- When the panel test mode is activated, the last used channel and signaling numbers are displayed. When the panel test mode is activated for the first time, the channel and signaling numbers are 1.
- If test signaling 26 (Tone Pattern) is selected, the result of Bit Error Rate (BER) calculation is displayed on the LCD. The BER value is also output from the serial port.

■ Key operation

Panel Tuning Mode

The transceiver is adjusted in this mode.

■ Preparations for tuning the transceiver

Before attempting to tune the transceiver, connect the unit to a suitable power supply.

Whenever the transmitter is turned, the unit must be connected to a suitable dummy load (i.e. power meter).

ADJUSTMENT

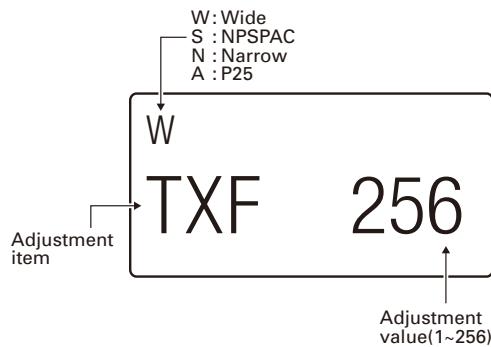

The speaker output connector must be terminated with a 4Ω dummy load and connected to an AC voltmeter and an audio distortion meter or a SINAD measurement meter at all times during tuning.

■ Transceiver tuning (To enter tuning mode)

To enter tuning mode, press the [GRP \wedge] key while the transceiver is in test mode.

Use the [PF5] key to write tuning data through tuning modes, and the [PF3] and [PF4] keys to adjust tuning requirements (1 to 256 appears on the LCD).

Use the [PF2] key to select the adjustment item through tuning modes. Use the [GRP \vee] key to exit 4, 6, 7, 8 or 12 reference level adjustments.

• LCD display in the panel tuning mode**■ Key operation**

Key	Function
[Selector]	Unused
[GRP \wedge]	Exit the panel tuning mode and shift to the panel test mode.
[GRP \vee]	Exit the 4, 6, 7, 8 or 12 reference level adjustments without backup.
[PF1]	Back to the last adjustment item (The current adjustment data is cleared.)
[PF2]	Go to the next adjustment item (The current adjustment data is cleared.)
[PF3]	Adjustment value down
[PF3] Hold	Adjustment value continuation down
[PF4]	Adjustment value up
[PF4] Hold	Adjustment value continuation up
[PF5]	Enter the 4, 6, 7, 8 or 12 reference level adjustments.
MIC PTT	Transmit

ADJUSTMENT

ADJUSTMENT

BER (Bit Error Rate) Measurement

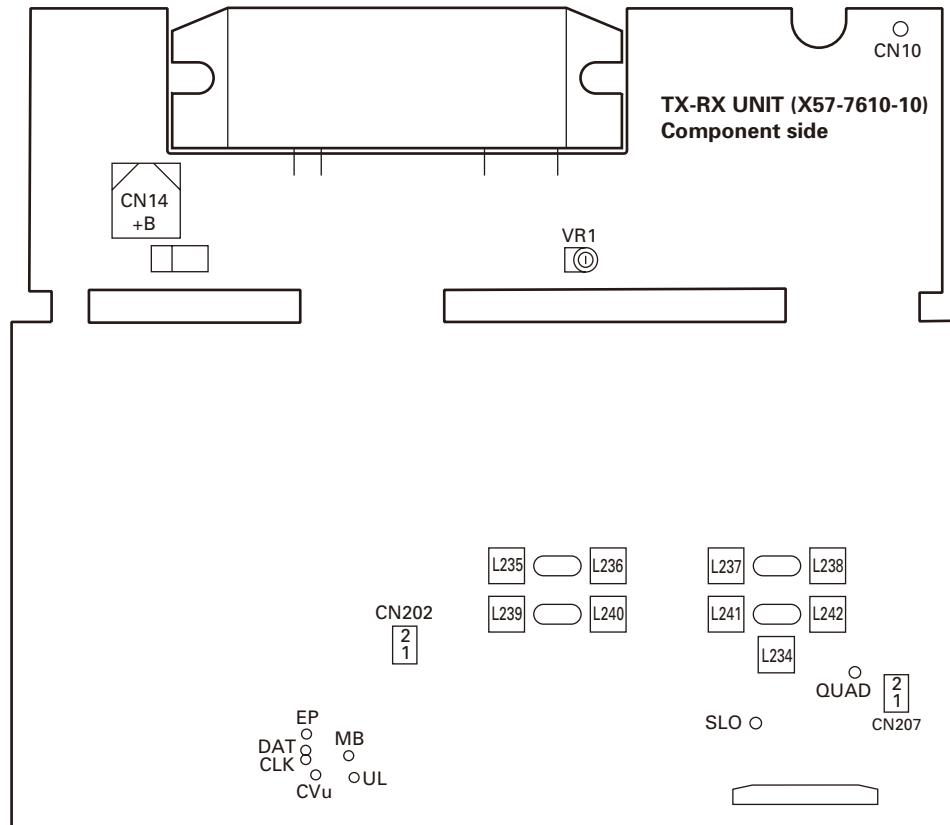

1. The Panel Test Mode is used to measure the BER (Refer to "Test mode operation features" described on page 46.).
2. Select "26" for test signaling (Refer to "Test Signaling" described on page 47.).
When "26" is selected for the test signaling, the filter is automatically selected to "P25".
(If there is no RF input signal, the display shows "500000")
3. Select a filter (Refer to "Filter Mode" described on page 47.).
4. Select a test frequency (Refer to "Test Frequency" described on page 47.).

5. Measure the BER (Bit Error Rate) using the digital radio tester. Enter a standard input signal into the transceiver as a standard tone test pattern.
6. Adjust the input signal level to achieve the standard bit error rate (BER).
(For example, if the BER is 5%, the display shows "050000".)

Adjustment Points

ADJUSTMENT

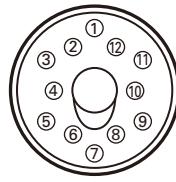

Test Equipment Required for Alignment

Test Equipment	Major Specifications	
1. Standard Signal Generator (SSG)	Frequency Range Modulation Output	700 to 950MHz Frequency modulation and external modulation -127dBm/0.1μV to greater than -47dBm/1mV
2. Power Meter	Input Impedance Operation Frequency Measurement Range	50Ω 700 to 950MHz or more Vicinity of 200W
3. Deviation Meter	Frequency Range	700 to 950MHz
4. Digital Volt Meter (DVM)	Measuring Range Input Impedance	1 to 20V DC High input impedance for minimum circuit loading
5. Oscilloscope		DC through 30MHz
6. High Sensitivity Frequency Counter	Frequency Range Frequency Stability	10Hz to 1000MHz 0.2ppm or less
7. Ammeter		30A
8. AF Volt Meter (AF VTVM)	Frequency Range Voltage Range	50Hz to 10kHz 3mV to 3V
9. Audio Generator (AG)	Frequency Range Output	50Hz to 5kHz or more 0 to 1V
10. Distortion Meter	Capability Input Level	3% or less at 1kHz 50mV to 10Vrms
11. Spectrum Analyzer	Measuring Range	DC to 1GHz or more
12. Tracking Generator	Center frequency Output Voltage	50kHz to 600MHz 100mV or more
13. 4Ω Dummy Load		Approx. 4Ω, 30W
14. Regulated Power Supply		13.6V, approx. 30A (adjusted from 9 to 20V) Useful if ammeter equipped

Caution

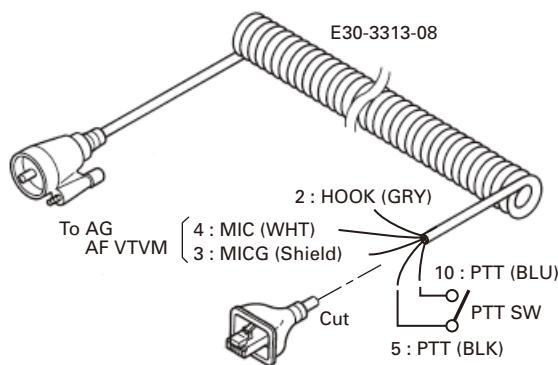

Since the RX AF output is a BTL output, there is a DC Component. Isolate this with a capacitor or transformer as shown in the figure.

33	ASQL	I	Analog squelch signal output
34	RSSI	I	RSSI signal output
35	TV	O	Tuning voltage signal input for RX BPF
36	E	-	GND

Pin No	Name	I/O	Function
CN502 (to ACC 9pin connector)			
1	IGN	I	Ignition sense Input.
2	E	-	Earth
3	HR1	O	Horn alert signal output 1. (1A max)
4	HR2	O	Horn alert signal output 2. (1A max)
5	oS2	O	BTL output for external speaker B (PA).
6	oS1	O	BTL output for external speaker B (PA).
7	ES2	O	BTL output for external speaker A.
8	ES1	O	BTL output for external speaker A.
9	IRS	I	Remote speaker switch.
CN503 (to KRK)			
1	AFo	O	RX audio signal output for Head 2
2	DE3	I/O	Detection signal
3	E	-	GND
4	EI	O	ENABLE of shift register
5	CLK	O	CLOCK
6	DAT	O	DATA
7	RESET	O	RESET
8	5C	-	Common 5V
9	PSC	I/O	Power switch control signal
10	CS	O	Chip select of D/A converter
CN504 (to Display Unit CN1)			
1	ES2	O	Output for remote speaker
2	IRS	O	Output for remote speaker
3	SB	O	Switched B
4	IGN	I	Ignition sense Input.
5	PSW	I	Power switch control signal input
6	TRD	I/O	TX data output/RX data input
7	1/2	O	Remote head 1 signal output
8	RESET	O	RESET
9	GND	-	GND
10	MIC	I	MIC signal input
11	ME	I	MIC GND

TERMINAL FUNCTION

TX-RX unit (X57-7610-10)

Transmitter Section

DISPLAY UNIT

To make measurements in the AF section, connect the AC level meter (ANT input: -53dBm, 1kHz FM, 3kHz DEV (W/D/E))

In the RF section, use 470pF coupling capacitor.

(The display shows the SSG input value required to obtain 12dB SINAD without local level.)

AG is set to the MIC input becomes 3kHz DEV at 1kHz MOD.(W/D/E)

To make measurements in the AF section, connect the AC level meter.

In the RF section, use 1000pF coupling capacitor.

SPECIFICATIONS

GENERAL

Frequency Range	700M: 763~775.99375 MHz (TX-RX)	793~805.99375 MHz (TX)
	800M: 851~870 MHz (TX-RX)	806~825 MHz (TX)
Number of Channels	1024	
Zones	100	
Max. Channels per Zone.....	512	
Channel Spacing	Analog: 12.5/25 kHz	Digital: 12.5 kHz
Operating Voltage	13.6V DC ± 15%	
Current Drain		
Standby	Less than 0.45A	
Receive.....	Less than 2.3A	
Transmit.....	13A	
Duty Cycle	Transmit: 20%	
Operating Temperature Range	-22°F to +140°F (-30°C to +60°C)	
Frequency Stability	±1.5 ppm	-22°F to +140°F (-30°C to +60°C)
Antenna Impedance	50Ω	
Dimensions (W x H x D) (Projections included)		
RF Deck only	7.01" x 2.36" x 10.3" in. (178 x 60 x 261 mm)	
with KCH-14 or KCH-15.....	7.05" x 2.36" x 11.7" in. (179 x 60 x 296 mm)	
Weight (net)		
RF Deck only	6.6 lbs. (3.0kg)	
with KCH-14	7.3 lbs. (3.3kg)	
with KCH-15	7.3 lbs. (3.3kg)	

RECEIVER

Sensitivity	Digital (5% BER): 0.25µV	Digital (1% BER): 0.40µV	
	Analog 12dB SINAD: 0.25µV		
Selectivity	Digital: -63dB	Analog @25kHz: -80dB	Analog @12.5kHz: -70dB
Intermodulation Distortion	Digital: -80dB	Analog @25kHz: -80dB	Analog @12.5kHz: -80dB
Spurious and Image	Digital: -85dB	Analog: -85dB	
Audio Distortion.....	Digital: Less than 1.0%	Analog: Less than 2.0%	
Audio Output	Internal (KCH-14) @3%: 1.5W/8Ω	External: @3%: 12W/4Ω	
	Internal (KCH-14) @5%: 1.625W/8Ω	External: @5%: 13W/4Ω	

TRANSMITTER

RF Output Power.....	30W to 2W (700M), 35W to 2W (800M)	
Spurious and Harmonics	80dB	
FM Hum and Noise	Analog @25kHz: 45dB	Analog @12.5kHz: 40dB
Microphone Impedance.....	600Ω	
Audio Distortion	Less than 2%	
Modulation	16K0F3E, 11K0F3E, 8K10F1E, 8K10F1D, 14K0F3E	

Analog measurements made per TIA/EIA-603

Digital measurements made per TIA/EIA-102CAAA

Layer 1

The diagram consists of two horizontal lines. The top line is labeled "Layer 2" and the bottom line is labeled "Layer 3". A single horizontal line connects the right end of the "Layer 2" line to the left end of the "Layer 3" line, indicating a connection between them.

The diagram consists of two horizontal bars. The top bar is labeled "Layer 3" and the bottom bar is labeled "Layer 4". Both labels are positioned to the left of their respective bars.
