## GENERAL

### INTRODUCTION

#### SCOPE OF THIS MANUAL

This manual is intended for use by experienced technicians familiar with similar types of commercial grade communications equipment. It contains all required service information for the equipment and is current as of this publication date. Changes which may occur after publication are covered by either Service Bulletins or Manual Revisions, which are issued as required.

### ORDERING REPLACEMENT PARTS

When ordering replacement parts or equipment information, the full part identification number should be included. This applies to all parts : components, kits, and chassis. If the part number is not known, include the chassis or kit number of which it is a part and a sufficient description of the required component for proper identification.

### PERSONAL SAFETY

The following precautions are recommended for personal safety :

- DO NOT transmit if someone is within two feet (0.6 meter) of the antenna.
- DO NOT transmit until all RF connectors are secure and any open connectors are properly terminated.
- SHUT OFF this equipment when near electrical blasting caps or while in an explosive atmosphere.
- All equipment should be properly grounded before power-up for safe operation.
- This equipment should be serviced by only qualified technicians.

### PRE-INSTALLATION CONSIDERATIONS

#### 1. UNPACKING

Unpack the radio from its shipping container and check for accessory items. If any item is missing, please contact KENWOOD immediately.

#### 2. PRE-INSTALLATION CHECKOUT

##### 2-1. Introduction

Each radio is adjusted and tested before shipment. However, it is recommended that receiver and transmitter operation be checked for proper operation before installation.

##### 2-2. Testing

The radio should be tested complete with all cabling and accessories as they will be connected in the final installation. Transmitter frequency, deviation, and power output should be checked, as should receiver sensitivity, squelch operation, and audio output. Signalling equipment operation should be verified.

### 3. PLANNING THE INSTALLATION

#### 3-1. General

Inspect the vehicle and determine how and where the radio antenna and accessories will be mounted.

Plan cable runs for protection against pinching or crushing wiring, and radio installation to prevent overheating.

#### 3-2. Antenna

The favored location for an antenna is in the center of a large, flat conductive area, usually at the roof center. The trunk lid is preferred, bond the trunk lid and vehicle chassis using ground straps to ensure the lid is at chassis ground.

#### 3-3. Radio

The universal mount bracket allows the radio to be mounted in a variety of ways. Be sure the mounting surface is adequate to support the radio's weight. Allow sufficient space around the radio for air cooling. Position the radio close enough to the vehicle operator to permit easy access to the controls when driving.

#### 3-4. DC Power and wiring

1. This radio may be installed in negative ground electrical systems only. Reverse polarity will cause the cable fuse to blow. Check the vehicle ground polarity before installation to prevent wasted time and effort.
2. Connect the positive power lead directly to the vehicle battery positive terminal. Connecting the Positive lead to any other positive voltage source in the vehicle is not recommended.
3. Connect the ground lead directly to the battery negative terminal.
4. The cable provided with the radio is sufficient to handle the maximum radio current demand. If the cable must be extended, be sure the additional wire is sufficient for the current to be carried and length of the added lead.

### 4. INSTALLATION PLANNING – CONTROL STATIONS

#### 4-1. Antenna system

Control station. The antenna system selection depends on many factors and is beyond the scope of this manual. Your KENWOOD dealer can help you select an antenna system that will best serve your particular needs.

#### 4-2. Radio location

Select a convenient location for your control station radio which is as close as practical to the antenna cable entry point. Secondly, use your system's power supply (which supplies the voltage and current required for your system). Make sure sufficient air can flow around the radio and power supply to allow adequate cooling.

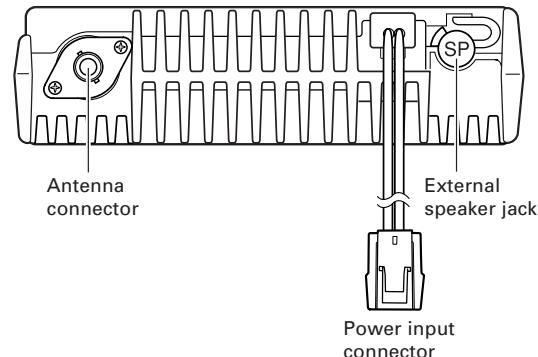

# GENERAL / SYSTEM SET-UP

## SERVICE

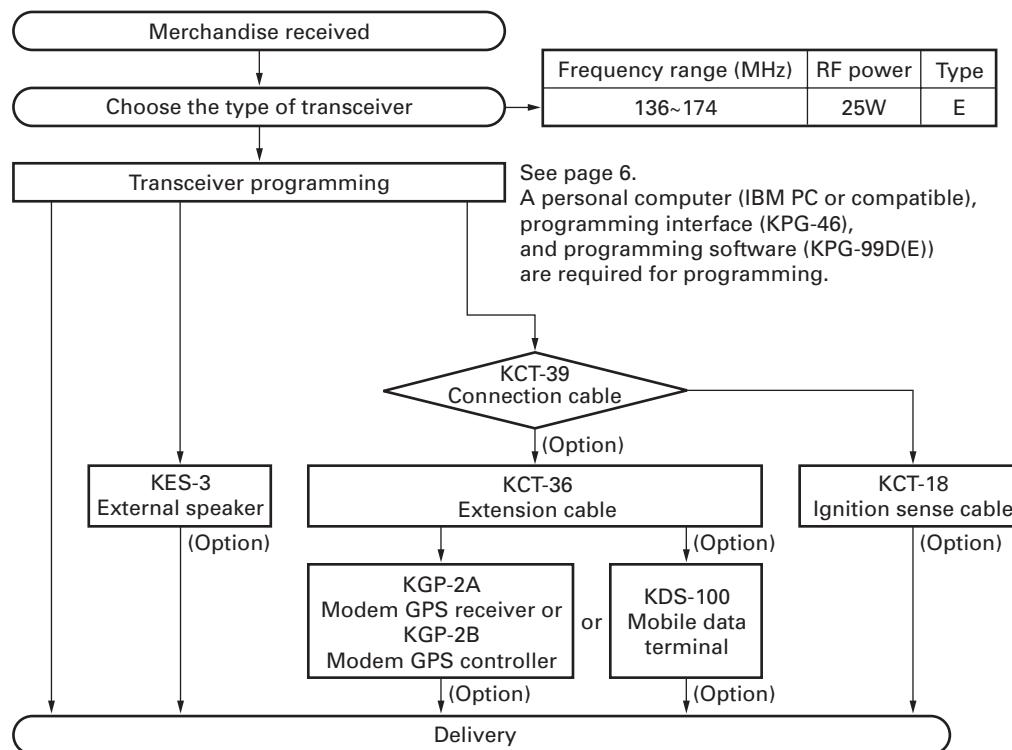

This radio is designed for easy servicing. Refer to the schematic diagrams, printed circuit board views, and alignment procedures contained in this manual.

## NOTE

If you do not intend to use the 3.5-mm jack for the external speaker, fit the supplied speaker-jack cap to stop dust and sand from getting in.

## REALIGNMENT

### 1. Modes

Mode	Function
User mode	For normal use.
PC mode	Used for communication between the transceiver and PC (IBM compatible).
PC programming mode	Used to read and write frequency data and other features to and from the transceiver.
PC test mode	Used to check the transceiver using the PC. This feature is included in the FPU.
PC tuning mode	Used to tune the transceiver using the PC.
Clone mode	Used to transfer programming data from one transceiver to another.
* Self programming mode	You can program the frequency, signalling and other functions using only the transceiver.

\* : Only TK-7160 transceiver

### 2. How to Enter Each Mode

Mode	Operation
User mode	Power ON
PC mode	Received commands from PC
Clone mode	[ <b>V</b> ]+Power ON (Two seconds)
* Self programming mode	[ <b>s</b> ]+Power ON (Two seconds)

\* : Only TK-7160 transceiver

### 3. PC Mode

#### 3-1. Preface

This transceiver is programmed using a personal computer, a programming interface (KPG-46) and programming software (KPG-99D(E)).

The programming software can be used with an IBM PC or compatible. Figure 1 shows the setup of an IBM PC for programming.

#### 3-2. Connection Procedure

1. Connect the transceiver to the personal computer with the interface cable.
2. When the Power is switched on, user mode can be entered immediately. When the PC sends a command, the transceiver enters PC mode.

When data is transmitted from transceiver, the TX indicator blink.

When data is received by the transceiver, the BUSY indicator blink.

In the PC mode, "PROGRAM" (TK-7160) or "P" (TK-7162) is displayed on the LCD.

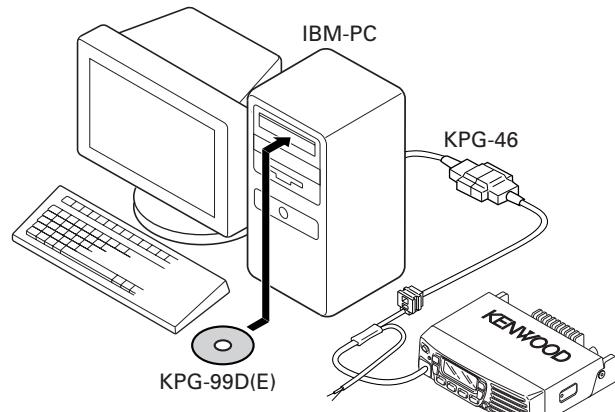

Fig. 1

TK-7160/TK-7162

#### 3-3. KPG-46 Description

##### (PC programming interface cable : Option)

The KPG-46 is required to interface the transceiver to the computer. It has a circuit in its D-subconnector (25-pin) case that converts the RS-232C logic level to the TTL level.

The KPG-46 connects the modular microphone jack of the transceiver to the computers RS-232C serial port.

#### 3-4. Programming Software Description

KPG-99D(E) is the programming software for transceiver supplied on a CD-ROM. This software runs under Windows 98, ME, Windows 2000 or XP on an IBM-PC or compatible machine.

The data can be input to or read from transceiver and edited on the screen. The programmed or edited data can be printed out. It is also possible to tune the transceiver.

#### 4. Clone Mode

Programming data can be transferred from one transceiver to another by connecting them via their modular microphone jacks. The operation is as follows (the transmit transceiver is the master and the receive transceiver is the slave).

##### Note :

Clone mode should be enabled.

1. Turn the master transceiver power ON with the [**V**] key held down (2 seconds), "CLONE" (TK-7160) or "C" (TK-7162) is displayed on the LCD.
2. Power on the slave transceiver.
3. Connect the cloning cable (No. E30-3382-05) to the modular microphone jacks on the master and slave.
4. Press the [**s**] key on the master transceiver. The data of the master is sent to the slave. While the master is sending data, red LED blinked. While the slave is receiving the data, "PROGRAM" (TK-7160) or "P" (TK-7162) is displayed and green LED blinked. When cloning of data is completed, the master displays "END" (TK-7160) or "E" (TK-7162), and the master red LED turned off, and the slave automatically operates in the User mode. The slave can then be operated by the same program as the master.
5. The other slave can be continuously cloned. Carry out the operation in step 2 to 4.

## 4-1. Adding the data password.

If the Read Authorization password is set in the optional feature menu, you must enter the password (Master transceiver) to activate a clone mode.

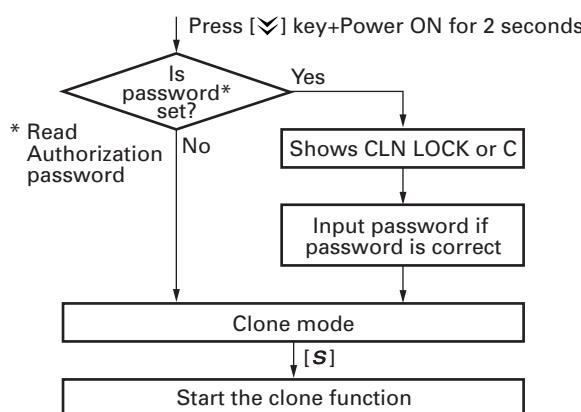

You can use 0~9 to configure the password. The maximum length of the password is 6 digits.

1. [  $\nabla$  ]+Power ON.
2. "CLN LOCK" (TK-7160) or "P" (TK-7162) is displayed on the LCD.
3. If the [  $\wedge$  ] and [  $\nabla$  ] keys is pressed while "CLN LOCK" (TK-7160) or "P" (TK-7162) is displayed, numbers (0 to 9) are displayed flashing. When you press the [  $c >$  ] key, the currently selected number is determined. If you press the [  $s$  ] key after entering the password in this procedure, "CLONE" (TK-7160) or "C" (TK-7162) is displayed if the entered password is correct. If the password is incorrect, "CLN LOCK" (TK-7160) or "P" (TK-7162) is redisplayed.

**Fig. 2**

## ■ Flow Chart (Master radio)

## 5. Self Programming Mode

Self programming mode operates with only the **TK-7160** transceiver.

Write mode for frequency data and signaling, etc. To be used ONLY by the authorized service person maintaining the user's equipment. After programming, reset the FPU to the "Self- Programming" disabled mode. Radios CANNOT be delivered to the end-user in the self-programming mode.

### 5-1. Enter to the Self Programming Mode

Hold down the [  $s$  ] key 2 seconds and turn the power switch on. When enter the self programming mode, "1- 1" is displayed 2 seconds after " SELF " is displayed.

### 5-2. Adding the Data Password

If the data password is set in the optional feature menu, you must enter the password to activate a self programming mode.

You can use 0~9 to configure the password. The maximum length of the password is 6 digits.

1. [  $s$  ]+Power ON.
2. "SLF.LOCK.R"\*\* is displayed on the LCD.
3. If the [  $\wedge$  ] and [  $\nabla$  ] keys is pressed while "SLF.LOCK.R" is displayed, numbers (0 to 9) are displayed flashing. When you press the [  $c >$  ] key, the currently selected number is determined. If you press the [  $s$  ] key after entering the password in this procedure, "SELF" is displayed if the entered password is correct. If the password is incorrect, "SLF.LOCK.R"\*\* is redisplayed.

\* Read authorization password → "SLF.LOCK.R"  
Overwrite password → "SLF.LOCK.W"

### Note :

This mode (self programming mode) cannot be set when it has been disabled with the FPU.

### 5-3. Channel Setting Mode

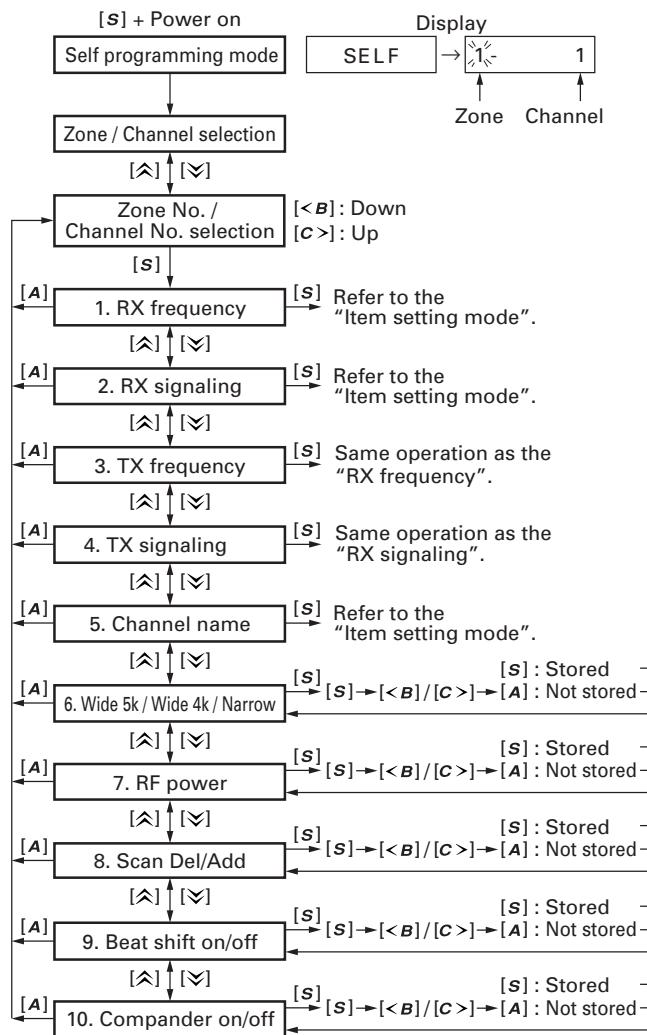

Each channel can be setup in its action mode by using the panel keys.

The 5-tone functions cannot be programmed in this mode.

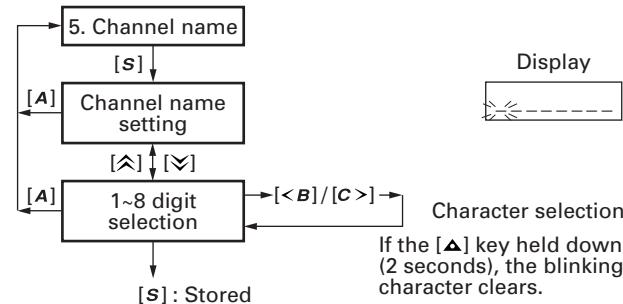

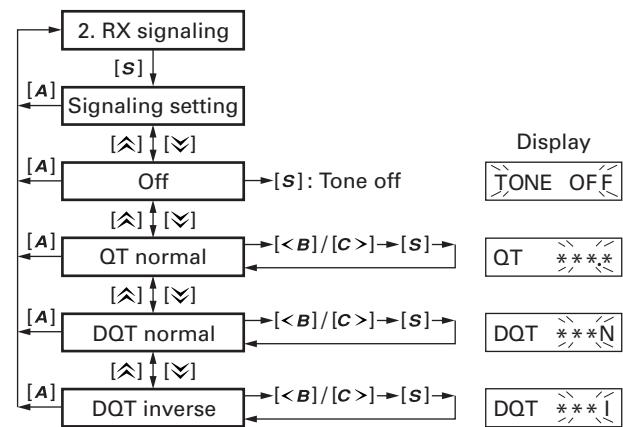

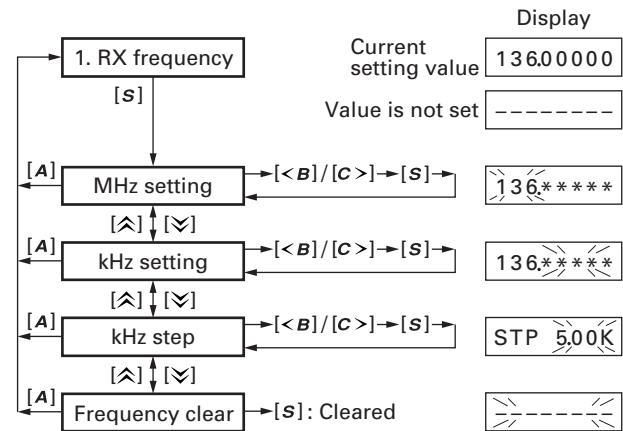

- Pressing [  $s$  ] when "1- 1" is displayed, sets channel setting mode.
- Select an item set using [  $s$  ] then change the selection with the [  $\wedge$  ] or [  $\nabla$  ].
- The data displayed using [  $s$  ] is stored in the memory.
- Pressing [  $\wedge$  ] proceeds to the next item without storing it in the memory.
- Press [  $a$  ] to set the display to " SELF " and return to reset (default) status.

**6. Accessory Connection Cable (KCT-39)**

The KCT-39 is an accessory connection cable for connecting external equipment. The connector has 15 pins and the necessary signal lines are selected for use.

**6-1. Installing the KCT-39 in the Transceiver**

1. Lift the DC cord bushing (①) from the chassis. Peel the pad as shown in Figure 3 (②).

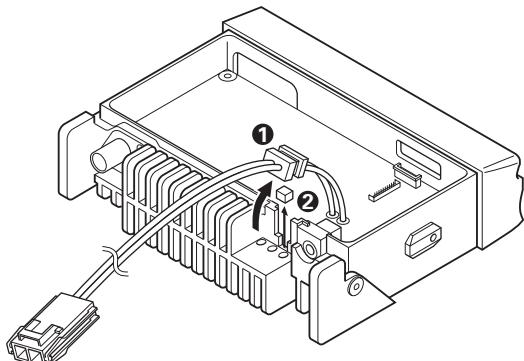

Fig. 3

2. Stick the pad to the DC cord (③) and chassis (④), both of which are supplied with the KCT-39.

## REALIGNMENT / DISASSEMBLY FOR REPAIR

### 7. Ignition Sense Cable (KCT-18)

The KCT-18 is an optional cable for enabling the ignition function. The ignition function lets you turn the power to the transceiver on and off with the car ignition key.

#### 7-2. Connecting the KCT-18 to the Transceiver

1. Install the KCT-39 in the transceiver. (See the KCT-39 section)
2. Insert the KCT-18 lead terminal (①) into pin 2 of the KCT-39 (②).

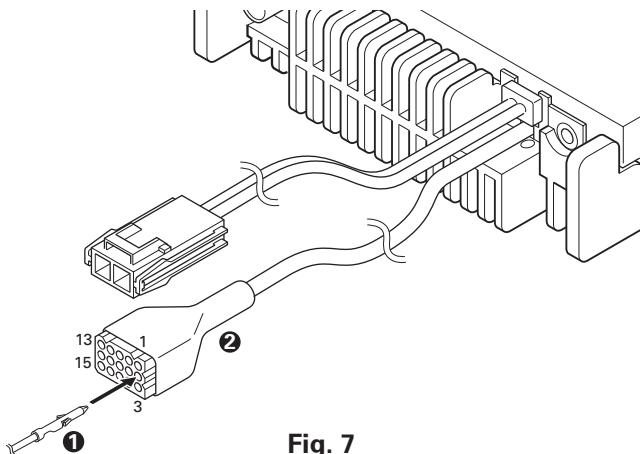

Fig. 7

#### 7-3. Modifying the Transceiver

Modify the transceiver as follows to turn the power on and off with the ignition key.

1. Remove the resistor R95 of the TX-RX unit.

#### ■ Setting With the KPG-99D(E)

Select "Function port" from the "Edit" menu and enable the "Ignition Sense".

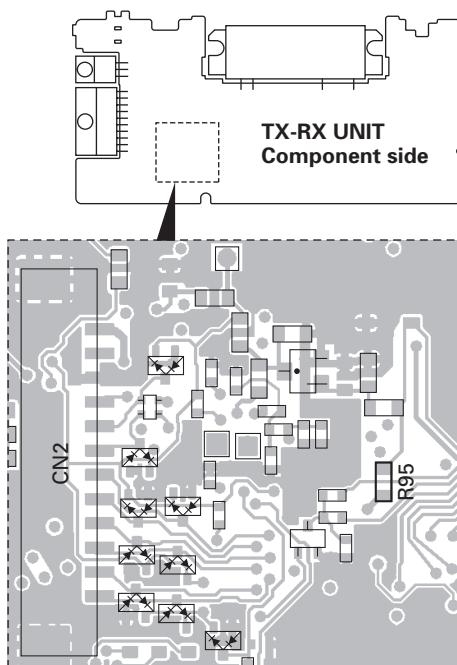

Fig. 8

1. When you remove the panel, turn the transceiver up side down. Detach the panel by lifting the tabs as shown below.

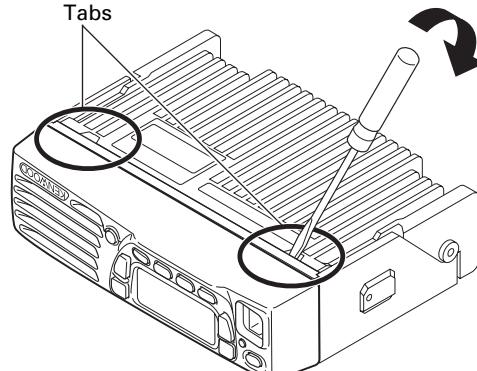

Fig. 1

2. To remove the cabinet, first turn the transceiver up side down. Detach the cabinet by prying the tabs as shown below.

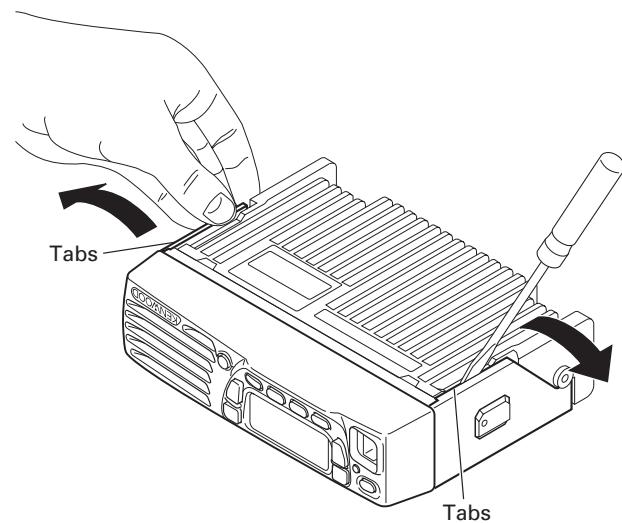

Fig. 2

3. When mounting the front panel, match the 4 tabs of the chassis with the panel, being sure they attach securely.

# CIRCUIT DESCRIPTION

## Frequency Configuration

The receiver utilizes double conversion. The first IF is 49.95MHz and the second IF is 450kHz. The first local oscillator signal is supplied from the PLL circuit.

The PLL circuit in the transmitter generates the necessary frequencies. Figure 1 shows the frequencies.

**Fig. 1 Frequency configuration**

## Receiver System

The receiver is double conversion superheterodyne. The frequency configuration is shown in Figure 1.

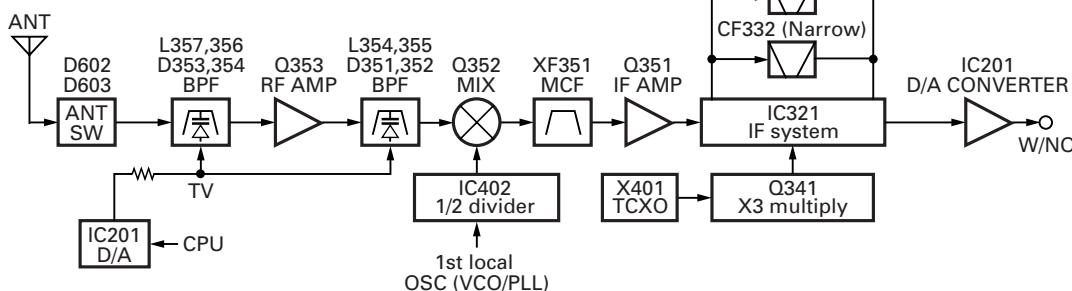

### Front-end RF Amplifier Circuit

An incoming signal from the antenna is applied to an RF amplifier (Q353) after passing through a transmit/receive switch circuit (D602 and D603 are off) and a band pass filter (L357, L356 and varactor diodes : D353, D354). After the signal is amplified (Q353), the signal is filtered through a band pass filter (L354, L355 and varactor diodes : D351, D352) to eliminate unwanted signals before it is passed to the first mixer.

The voltage of these diodes are controlled by tracking the CPU (IC101) center frequency of the band pass filter. (See Fig. 2)

### First Mixer Circuit

The signal from the RF amplifier is heterodyned with the first local oscillator signal from the PLL frequency synthesizer circuit at the first mixer (Q352) to create a 49.95MHz first intermediate frequency (1st IF) signal. The first IF signal is then fed through a monolithic crystal filter (MCF : XF351) to further remove spurious signals.

**Fig. 2 Receiver system**

### IF Amplifier Circuit

The first IF signal is amplified by Q351, and the enters IC321 (FM processing IC). The signal is heterodyned again with a second local oscillator signal within IC321 to create a 450kHz second IF signal. The second IF signal is then fed through a 450kHz ceramic filter (Wide : CF331, Narrow : CF332) to further eliminate unwanted signals before it is amplified and FM detected in IC321.

## CIRCUIT DESCRIPTION

### ■ Wide/Narrow Switching Circuit

The Wide port (pin 23) and Narrow port (pin 22) of the CPU is used to switch between ceramic filters. When the Wide port is high, the ceramic filter SW diodes (D332, D331) cause CF331 to turn on to receive a Wide signal.

When the Narrow port is high, the ceramic filter SW diodes (D332, D331) cause CF332 to turn on to receive a Narrow signal.

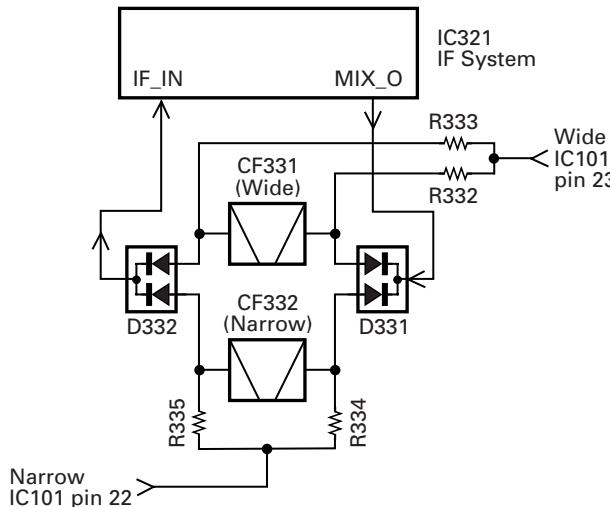

Fig. 3 Wide/Narrow switching circuit

### ■ AF Signal System

The detection signal from IF IC (IC321) goes to D/A converter (IC201) to adjust the gain and is output to AQUA IC (IC241) for characterizing the signal. The AF signal output from IC241 and the DTMF/MSK signal, BEEP signal are summed and the resulting signal goes to the D/A converter (IC201). The AFO output level is adjusted by the D/A converter. The signal output from the D/A converter is input to the audio power amplifier (IC281). The AF signal from IC281 switches between the internal speaker and speaker jack (J1) output.

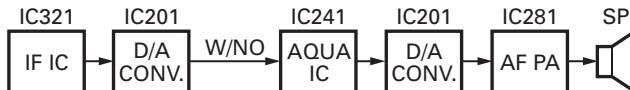

Fig. 4 AF signal system

### ■ Squelch Circuit

The detection output from the FM IF IC (IC321) passes through a noise amplifier (Q301) to detect noise. A voltage is applied to the CPU (IC101). The CPU controls squelch according to the voltage (SQIN) level. The signal from the RSSI pin of IC321 is monitored. The electric field strength of the receive signal can be known before the SQIN voltage is input to the CPU, and the scan stop speed is improved.

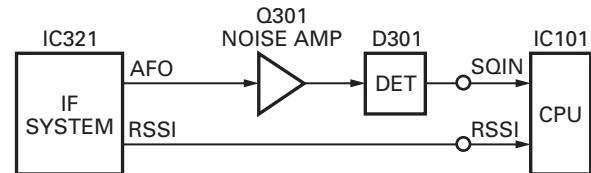

Fig. 5 Squelch circuit

### PLL Frequency Synthesizer

The PLL circuit generates the first local oscillator signal for reception and the RF signal for transmission.

#### ■ PLL Circuit

The frequency step of the PLL circuit is 5 or 6.25kHz. A 16.8MHz reference oscillator signal is divided at IC401 by a fixed counter to produce the 5 or 6.25kHz reference frequency. The voltage controlled oscillator (VCO) output signal is buffer amplified by Q446, then divided in IC401 by a dual-module programmable counter. The divided signal is compared in phase with the 5 or 6.25kHz reference signal in the phase comparator in IC401. The output signal from the phase comparator is filtered through a low-pass filter and passed to the VCO to control the oscillator frequency. (See Fig. 6)

#### ■ VCO Circuit

The operating frequency is generated by Q444 in transmit mode and Q441 in receive mode. The oscillator frequency is controlled by applying the VCO control voltage, obtained from the phase comparator, to the varactor diodes (D443 and D444 in transmit mode and D441 and D442 in receive mode). The TX/RX pin is set low in receive mode causing Q443 and Q442 to turn Q444 off, and turn Q441 on. The TX/RX pin is set high in transmit mode. The outputs from Q441 and Q444 are amplified by Q446 and sent to the RF amplifiers.

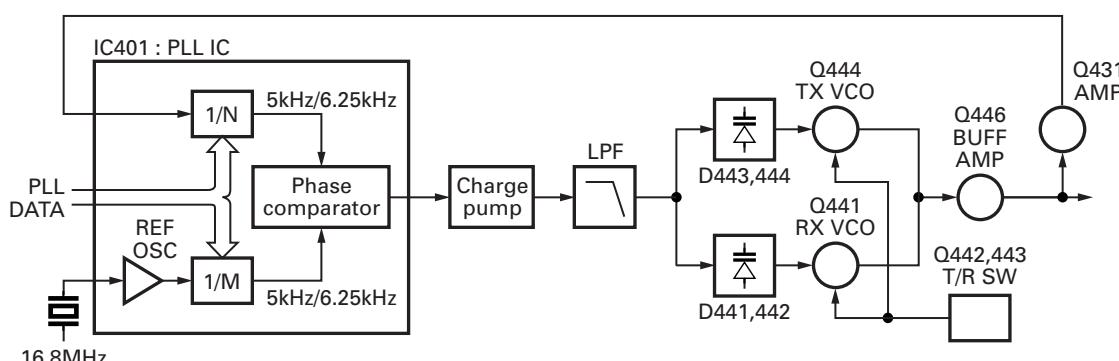

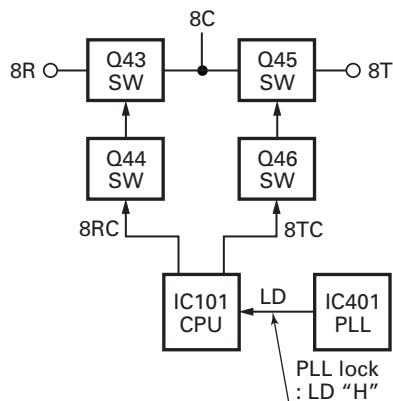

Fig. 6 PLL circuit

# CIRCUIT DESCRIPTION

## ■ Unlock Circuit

During reception, the 8RC signal goes high, the 8TC signal goes low, and Q44 turns on. Q43 turns on and a voltage is applied to the collector (8R). During transmission, the 8RC signal goes low, the 8TC signal goes high and Q46 turns on. Q45 turns on and a voltage is applied to 8T.

The CPU in the control unit monitors the PLL (IC401) LD signal directly. When the PLL is unlocked during transmission, the PLL LD signal goes low. The CPU detects this signal and makes the 8TC signal low. When the 8TC signal goes low, no voltage is applied to 8T, and no signal is transmitted.

**Fig. 7** Unlock circuit

## Transmitter System

### ■ Outline

The transmitter circuit produces and amplifies the desired frequency directly. It FM-modulates the carrier signal by means of a varicap diode.

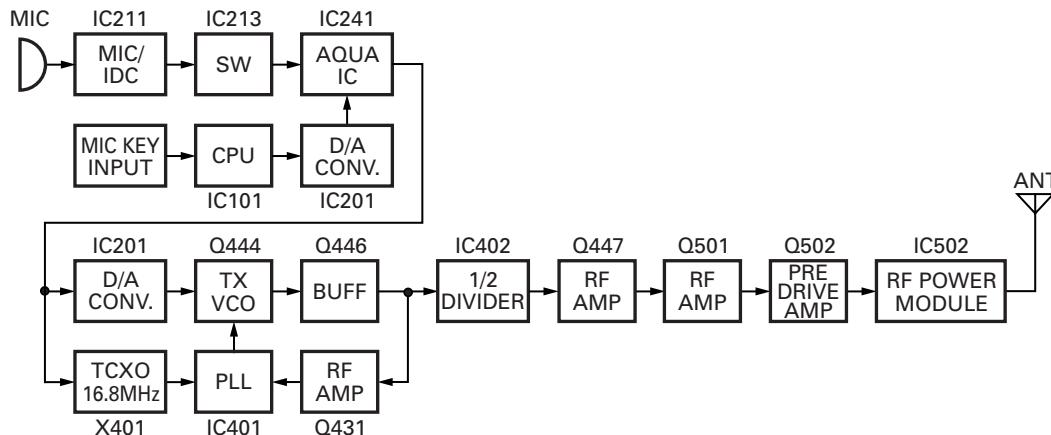

### ■ Power Amplifier Circuit

The transmit output signal from the VCO passes through the transmission/reception selection diode (D448) and amplified by Q501 and Q502. The amplified signal goes to the RF power module (IC502) through a low-pass filter. The low-pass filter removes unwanted high-frequency harmonic components, and the resulting signal is goes the antenna terminal.

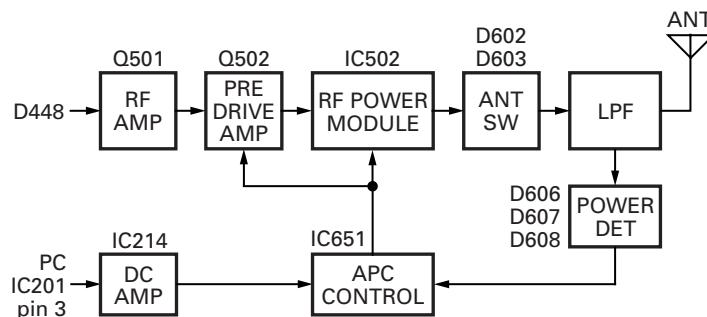

### ■ APC Circuit

The automatic transmission power control (APC) circuit detects part of a final amplifier output with a diode (D606, D607 and D608) and applies a voltage to IC651. IC651 compares the APC control voltage (PC) generated by the D/A converter (IC201) and DC amplifier (IC214) with the detection output voltage. IC651 generates the voltage to control Q502 and IC502 and stabilizes transmission output.

The APC circuit is configured to protect over current of Q502 and IC502 due to fluctuations of the load at the antenna end and to stabilize transmission output at voltage and temperature variations.

## CIRCUIT DESCRIPTION

### Control Circuit

- The CPU carries out the following tasks:
- 1) Controls the WIDE, NARROW, TX/RX outputs.
  - 2) Controls the AQUA IC (IC241).
  - 3) Controls the PLL (IC401).
  - 4) Controls the D/A converter (IC201) and adjusts the volume, modulation and transmission power.

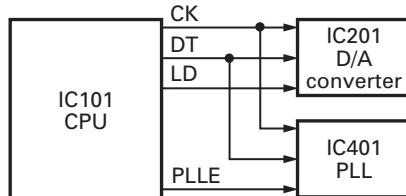

Fig. 10 Control circuit

### Memory Circuit

The transceiver has an 64k-bit EEPROM (IC81). The EEPROM contains adjustment data. The CPU (IC101) controls the EEPROM through three serial data lines.

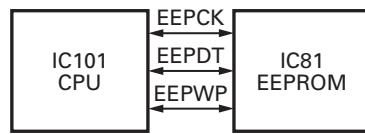

Fig. 11 Memory circuit

### Display Circuit

The CPU (IC101) controls the display LCD and LEDs. When power is on, the CPU will use the MBL line to control the LCD illumination and key backlight LEDs.

The dimmer function is controlled by the switch Q1\*. The LCD controller (IC1) controls the functions of the LCD through the DO, CE, CL, DI lines from the CPU.

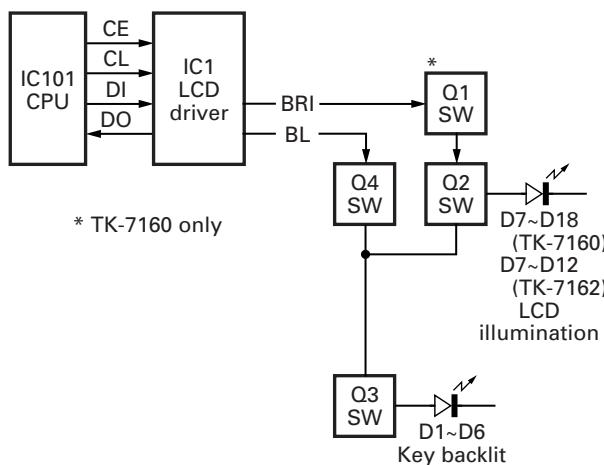

Fig. 12 Display circuit

### ■ Key Matrix Circuit

The TK-7160/7162 front panel has function keys. the TK-7162 terminal name are parenthesis inside. Each of them is connected to a cross point of a matrix of the KMI1 (KI3) to KMO3 (KS4) ports of the IC1 LCD driver. The KMO1 (KS2) to KMO3 (KS4) ports are always high, while the KMI1 (KI3) to KMI3 (KI1) ports are always low.

The microprocessor monitors the status of the KMI1 (KI3) to KMO3 (KS4) ports. If the state of one of the ports changes, the microprocessor assumes that the key at the matrix point corresponding to that port has been pressed.

### Signaling Circuit

#### ■ Encode

##### • Low-speed data (QT, DQT)

Low -speed data is output from pin 1 of the CPU (IC101). The signal passes through a low-pass CR filter. The signal is mixed with the audio signal and goes to the VCO and TCXO (X401) modulation input after passing through the D/A converter (IC201) for BAL adjustment.

##### • High-speed data (5-tone, DTMF)

High-speed data (HSD) is output from pin 2 of the CPU. The signal passes through a low-pass CR filter. TX deviation making an adjustment by microprocessor is passed through the switch (IC213) and then applied to the audio processor (IC241). The signal is mixed with the audio signal and goes to the VCO and TCXO.

The RX tone is passed a summing amplifier (IC241). The D/A converter (IC201) for audio control, audio power amplifier and then to the speaker.

#### • MSK

MSK signal is output from pin 6 of IC241. The signal passes through the D/A converter (IC201) for the MSK deviation adjustment, and is routed to the VCO. When encoding MSK, the microphone-input signal is muted.

# CIRCUIT DESCRIPTION

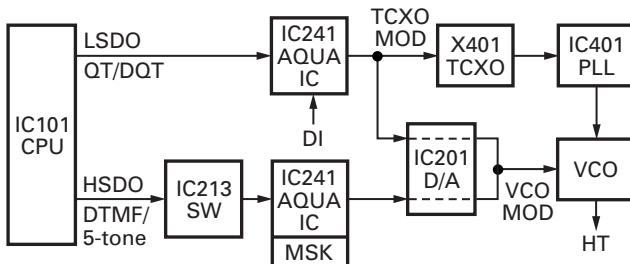

Fig. 14 Encode

## • MSK

The MSK input signal from the IF IC goes to pin 5 of IC241. The signal is demodulated by MSK demodulator in IC241. The demodulated data goes to the CPU for processing.

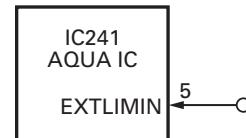

Fig. 15 Decode

## ■ Decode

### • Low-speed data (QT, DQT)

The demodulated signal from the FM IC (IC321) is passed through a low-pass filter (IC211 1/2) to remove frequency of 300Hz or more.

The signal is input to pin 88 of the CPU. The CPU digitizes this signal, performs processing such as DC restoration, and decodes the signal.

### • High-speed data (DTMF)

The DTMF input signal from the IF IC is amplified by IC241 and goes to the DTMF decoder in the IC241. The CPU then processes the decoded information.

### • High-speed data (5-tone)

The demodulated signal from the IF IC (IC321) is amplified by IC241 and passes through a high-pass filter to remove frequency of 300Hz or less. The CPU digitizes this signal and decodes the signal.

## Power Supply Circuit

When the power switch on the display unit is pressed, the power port on the display unit which is connected port 17 (POWER), goes low, then port 78 (SBC) goes high, Q42 turns on, SB SW (Q31) turns on and power (SB) is supplied to the radio.

When the DC power supplied to the radio, the voltage regulator IC (IC43) supply into the CPU VDD and reset voltage detect IC (IC44). IC44 will generate signal (RESET) in to the reset terminal on the CPU (IC101) to carry out a power ON reset. Also, CPU (IC101) is checking on port 91 (BATT). If DC power is less than about 9.5V, the radio is unable to power on.

When the DC power voltage deceases from normal voltage, the INT voltage detector IC (IC45) will set to high on CPU port 18 (INT). If B line becomes less than about 9.5V, CPU will send the backup data to EEPROM (IC81) and go into STOP mode.

This circuit has an overvoltage protection circuit. If a DC voltage of 16V or higher is applied to the base of Q81, this voltage turns Q81 on and sets port 18 (INT) to low. As a result port 78 (SBC) is low, and turns Q42 and Q31 (SB) off.

## ADJUSTMENT

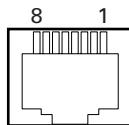

### Test Equipment Required for Alignment

Test Equipment	Major Specifications	
1. Standard Signal Generator (SSG)	Frequency Range	136 to 175MHz
	Modulation	Frequency modulation and external modulation
	Output	-127dBm/0.1μV to greater than -7dBm/100mV
2. Power Meter	Input Impedance	50Ω
	Operation Frequency	136 to 175MHz or more
	Measurement Capability	Vicinity of 100W
3. Deviation Meter	Frequency Range	136 to 175MHz
4. Digital Volt Meter (DVM)	Measuring Range	1 to 20V DC
	Accuracy	High input impedance for minimum circuit loading
5. Oscilloscope		DC through 30MHz
6. High Sensitivity Frequency Counter	Frequency Range	10Hz to 1000MHz
	Frequency Stability	0.2ppm or less
7. Ammeter		20A
8. AF Volt Meter (AF VTVM)	Frequency Range	50Hz to 10kHz
	Voltage Range	1mV to 3V
9. Audio Generator (AG)	Frequency Range	20Hz to 20kHz or more
	Output	0 to 1V
10. Distortion Meter	Capability	3% or less at 1kHz
	Input Level	50mV to 10Vrms
11. 4Ω Dummy Load		Approx. 4Ω, 10W or more
12. Regulated Power Supply		13.6V, approx. 20A (adjustable from 9 to 17V)
		Useful if ammeter equipped
13. Spectrum Analyzer	Center frequency	50KHz to 600MHz
14. Tracking Generator	Output Voltage	100mV or more

### Test cable for microphone input (E30-3360-08)

### Tuning cable (E30-3383-05)

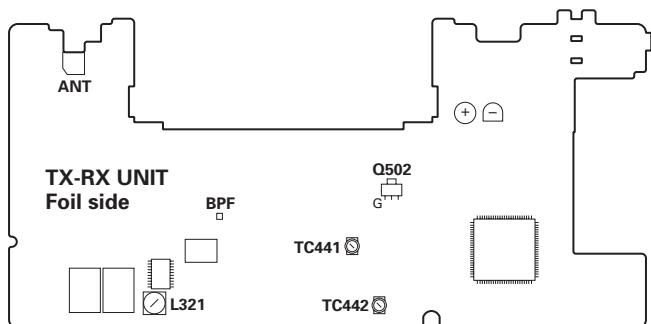

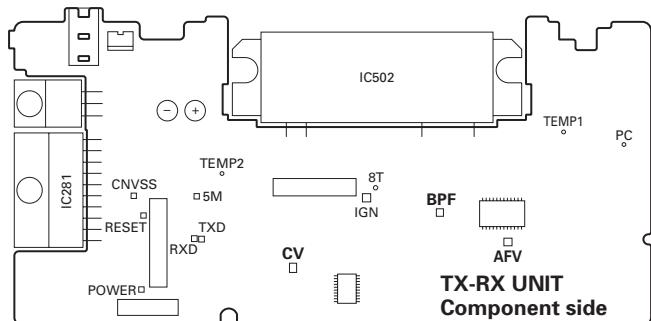

Adapter cable (E30-3383-05) is required for injecting an audio if PC tuning is used. See "PC Mode" section for the connection.

## ADJUSTMENT

## Adjustment Location

## ■ Adjustment Points

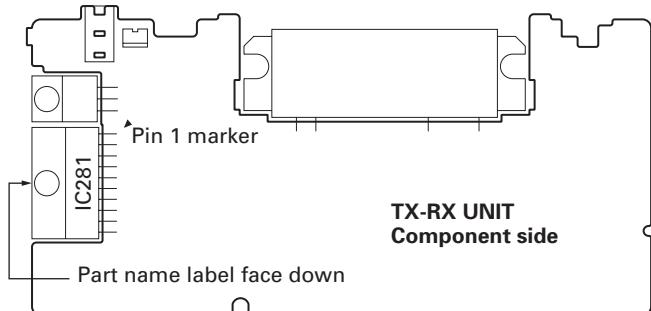

## ■ Notes

## • EEPROM

The tuning data (Deviation, Squelch, etc.) for the EEPROM, is stored in memory. When parts are changed, re-adjust the transceiver.

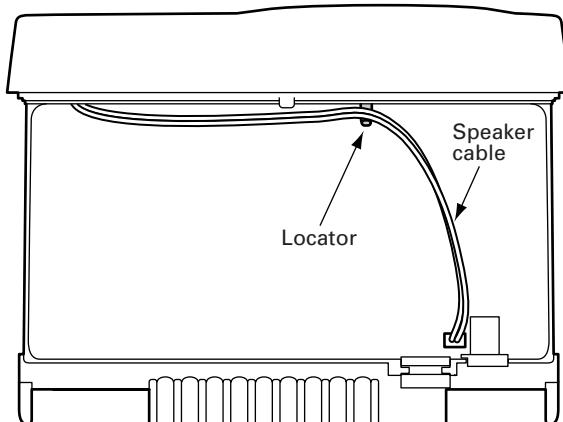

## • AF PA IC (IC281)

How to mounting the IC281.

## • Speaker Cable

The speaker cable should be formed before mounting the shield cover as below.

**If normal power is not obtained, please follow the step below**

Open the shielding cover (upper), and screw 3 locations around ANT pin.

1. Switch off the transceiver.

Impedance of Power module (IC502) can be measured easily using DVM  $\Omega$  mode.

Normal condition

Input :  $20\text{k}\Omega \sim 50\text{k}\Omega$ , Output :  $1\text{M}\Omega \sim 2\text{M}\Omega$

The above impedance values are rough estimations.

2. Check input power level at Drive FET (Q502) gate location. Connect the wire to [RF] location. Transmit and check for power to be within the range of  $0.3\text{W} \sim 0.6\text{W}$ . If power found is less than  $0.3\text{W}$ , check the circuit before the Drive FET.

## LEVEL DIAGRAM

### Receiver Section

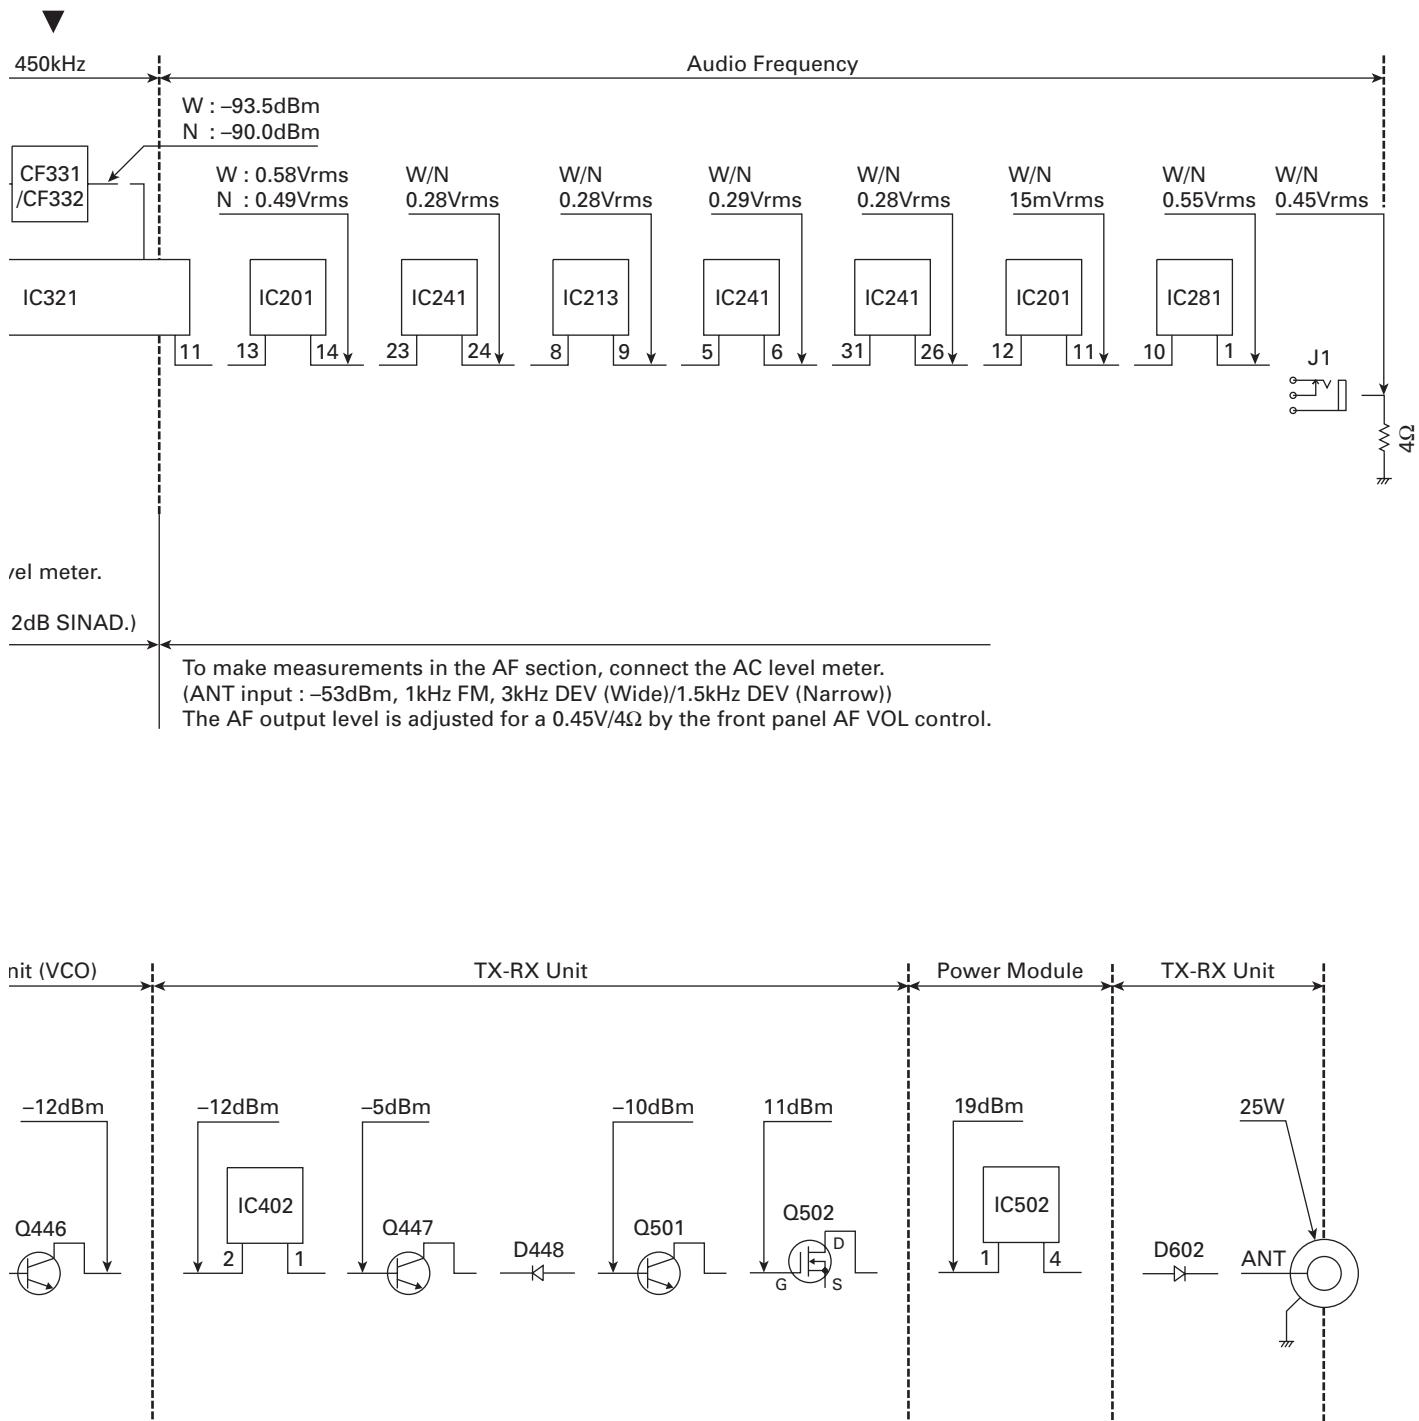

To make measurements in the RF section, connect the RF level meter.  
In the RF section, use a  $0.01\mu F$  coupling capacitor.  
(The display shows the SSG input value required to obtain 12dB SIN/A)

### Transmitter Section

To make measurements in the AF section, connect the AC level meter.  
AG is set so that MIC input becomes 3kHz/1.5kHz (Wide/Narrow) DEV at 1kHz MOD.

## SPECIFICATIONS

### GENERAL (Applicable standards : EN standard, AS-4295)

Frequency range .....	136~174MHz
Number of channels	
TK-7160 .....	Max. 128 Channels total per radio
	Zone : Max. 128 per radio
	Channel : Max. 128 per zone
TK-7162 .....	Max. 16 Channels
Channel spacing .....	Wide 5k : 25kHz    Wide 4k : 20kHz    Narrow : 12.5kHz
Operating voltage .....	13.6 V DC ±15%
Operating temperature range.....	-30°C~+60°C
Frequency stability .....	±2.5ppm (-30°C~+60°C)
Antenna impedance .....	50Ω
Channel frequency spread .....	38MHz
Dimensions (W x H x D Projections not included) .....	160 x 43 x 107 mm
Weight (net) .....	1.0 kg

### RECEIVER (Measurements made per EN standard)

Sensitivity	
EIA 12dB SINAD .....	Wide 5k : 0.28μV    Wide 4k : 0.28μV    Narrow : 0.35μV
EN 20dB SINAD .....	Wide 5k : -3dBμV    Wide 4k : -3dBμV    Narrow : -2dBμV
Adjust channel selectivity .....	Wide 5k : 70dB    Wide 4k : 70dB    Narrow : 60dB
Inter modulation .....	65dB
Spurious response rejection .....	70dB
Audio output (8Ω impedance) .....	4W with less than 5% distortion

### TRANSMITTER (Measurements made per EN standard)

RF output power .....	5~25W
Modulation limiting .....	Wide 5k : ±5.0 kHz at ±25 kHz Wide 4k : ±4.0 kHz at ±20 kHz Narrow : ±2.5 kHz at ±12.5 kHz
Spurious emission .....	-36dBm ≤ 1GHz, -30dBm > 1GHz
FM noise (EIA) .....	Wide 5k : 45dB    Narrow : 40dB
Modulation distortion .....	Wide 5k : 3%    Narrow : 5%
