CIRCUIT DESCRIPTION

Frequency Configuration

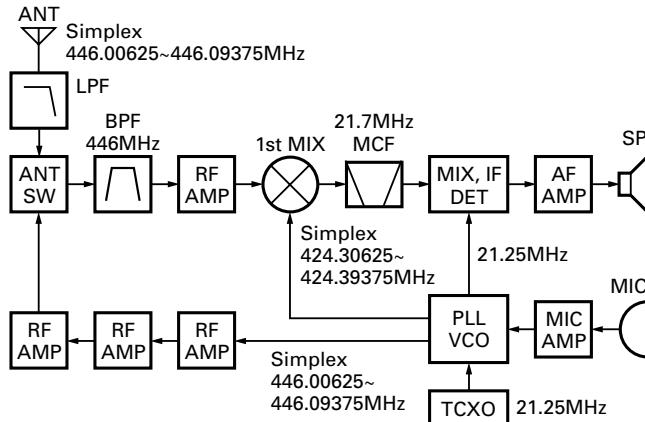

Fig. 1 Frequency configuration

Reception method	Double super heterodyne	
	1st IF frequency	21.7MHz (Lower)
	2nd IF frequency	450kHz (Lower)
Transmission method	VCO direct amplification	
Modulation	Variable reactance phase modulation	

Table 1

Receiver System

■ Front End

The high-frequency signal received from antenna passes through a LPF (Low pass filter : components between ANT and C73) to filter out unwanted high frequency signal. A switch diode system (D8, L32 and D10) allows this signal to pass through and enters the BPF (Band pass filter : L31) to eliminate unwanted signal when receiving.

The resulting signal is amplified by high-frequency amplifier (Q9) and goes to the first mixer (Q10).

■ First Mixer

The amplified signal that reaches Q10 is mixed with the first local signal from a VCO to produce a first IF signal (21.7MHz).

(Receive frequency – First local frequency

= First IF frequency = 21.7MHz)

The first IF signal passes through MCF (Monolithic crystal filter) XF1 to eliminate unwanted components.

The first IF signal is amplified by IF amplifier (Q11) before going into FM IC (IC2).

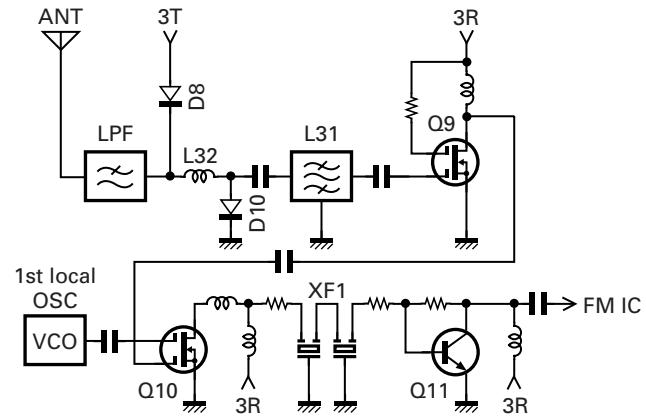

Fig. 3 Receiver front end and Mixer circuit

Item	Rating
Nominal center frequency (fo)	21.7MHz
Pass bandwidth	$\pm 3.75\text{kHz}$ or more at 3dB
Attenuation bandwidth	$\pm 14\text{kHz}$ or less at 40dB
Ripple	1dB or less
Insertion loss	3.5dB or less
Ultimate attenuation	80dB or more ($\text{fo} \pm 910\text{kHz}$)
Spurious responses	40dB or more ($\text{fo} \pm 1\text{MHz}$)
Terminating impedance	$850\Omega \pm 5\%$ // $5\text{pF} \pm 0.5\text{pF}$

Table 2 MCF (L71-0616-05) : TX-RX Unit XF1

Item	Rating
Nominal center frequency (fo)	450kHz
6dB bandwidth	$\pm 4.5\text{kHz}$ or more
50dB bandwidth	$\pm 10\text{kHz}$ or less
Ripple ($450\text{kHz} \pm 3\text{kHz}$)	3dB or less
Guaranteed attenuation ($\pm 100\text{kHz}$)	40dB or more
Insertion loss	4dB or less
I/O matching impedance	$2.0\text{k}\Omega \pm 10\%$

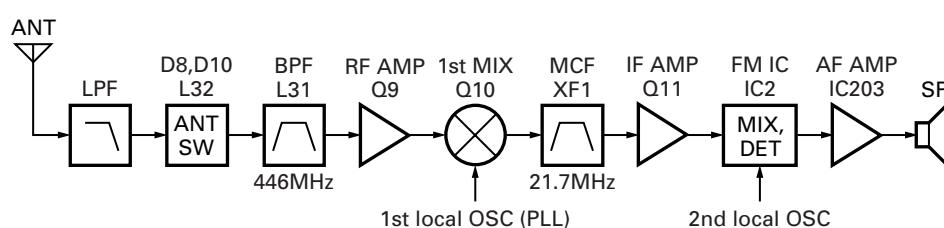

Fig. 2 Receiver section configuration

CIRCUIT DESCRIPTION

■ IF Amplifier

The IF circuit consists of FM IC (IC2). This IC contains local line input buffer, Mixer, FM DET and audio frequency amplifier.

The First IF signal that comes from IF amplifier (Q11) then goes into the FM IC mixer. It is mixed with second local frequency (21.25MHz) that comes from the PLL IC reference oscillation crystal so as to produce a second IF signal.
(21.7MHz – 21.25MHz = 2nd IF = 450kHz)

The 2nd IF signal then enters to ceramic filter (CF1) in order to eliminate unwanted components. The filtered signal is amplified by a limiter-amplifier, which consists of 6 differential amplifiers, to eliminate AM signal from 2nd IF.

The FM detector acts as a quadrature discriminator. The phase of the output signal from the limiter is shifted by 90 degrees by a quad coil (L36). This output signal is compared with the original non-shifted waveform to produce FM detection output.

■ Squelch Circuit

A squelch circuit is provided to prevent interference from noise or weak signal being output to the speaker during non-transmitting state.

This circuit contains an amplifier (Q13) and a rectifier (D11). The amplifier amplifies noise signals from FM detection output and passes them to a rectifier.

When there is no signal or weak signal being received, the FM IC detection will output high frequency noise and the rectifier will output high voltage level. When strong signal is received, the FM IC detection noise is suppressed and the rectifier output voltage level will be low.

MPU compares this rectifier output level to a predetermined level so as to determine when to turn on the speaker. Noise amplifier (Q13) and rectifier (D11) are used here instead of FM IC internal circuit to prevent temperature tolerance.

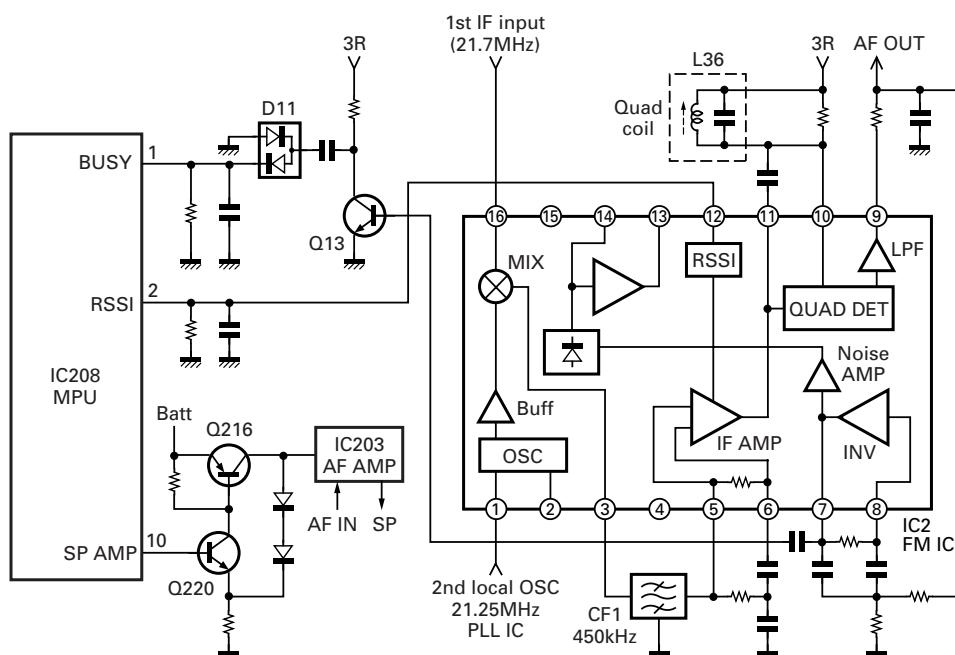

Fig. 4 IF amplifier and Squelch circuit

■ AF Amplifier

The FM detection output signal passes through the base band IC (IC209) which consists of band pass filter (300Hz~3kHz), de-emphasis circuit and amplifier. Next, the signal is passed to the volume control potential meter VR201 and then goes into the audio power amplifier (IC203) which drives the speaker to produce audio output.

■ Loudness ON/OFF Circuit

Loud On/Off switching circuit is controlled by AF switch (Q217, Q219, Q218). When Loud on, Q217 is On Q218 is Off. When Loud off, Q217 is off Q218 is on.

When the SP/MIC option is inserted, Loud circuit becomes Off automatically.

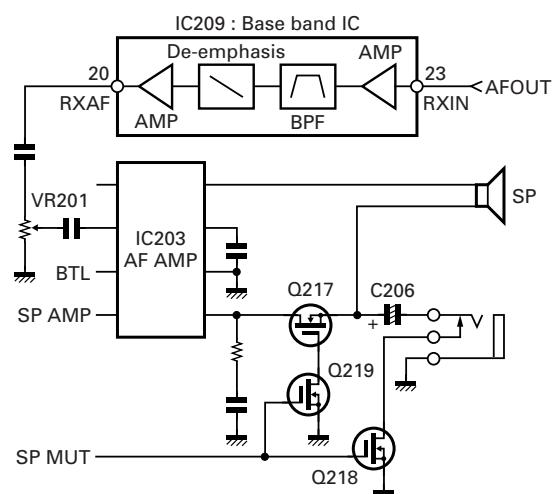

Fig. 5 AF amplifier and Loudness on/off circuit

CIRCUIT DESCRIPTION

Transmitter System

■ Microphone Amplifier Circuit

The audio signal acquired from the microphone (MIC200) passes through the MIC amplifier (IC204) to perform signal amplification. An AGC (Automatic gain control) circuit is included to maintain output audio signal level.

The amplified signal passes through the amplifier, pre-emphasis circuit, limiter and Splatter filter contained inside base band IC (IC209) and reaches the VCO as modulation signal. The splatter filter will eliminate the distortion components outside the audio band.

■ Modulation Circuit

The output signal of the base band IC passes through VR1 for Max Deviation Adjustment and goes to the modulation input of the VCO circuit for a variable reactance phase modulation.

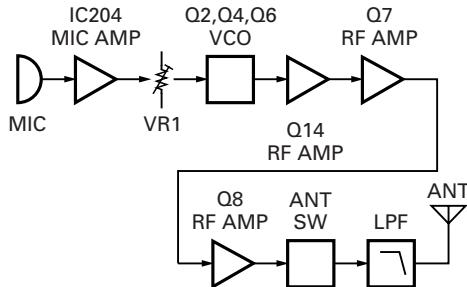

Fig. 6 Transmitter section configuration

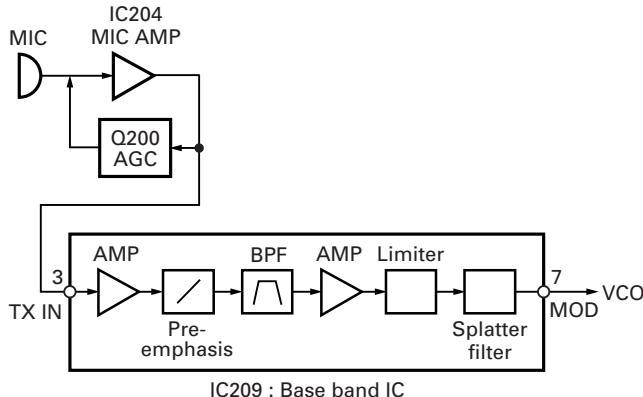

Fig. 7 Microphone amplifier circuit

■ VOX Circuit

After amplified by MIC amplifier (IC204), MIC signal passes through VOX amplifier (Q201) to eliminate signal which is out of frequency range 300Hz~2.5kHz.

The resulting signal goes into rectifier (D203) and converts into DC level. This DC level is compared with preset value in MPU. If the level is higher than preset, MPU will start transmitting.

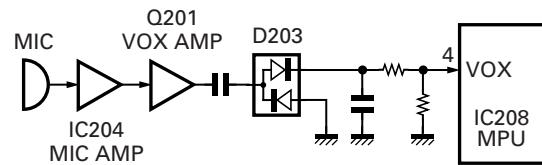

Fig. 8 VOX circuit

■ Transmission Output Circuit

The VCO output is amplified by a high-frequency amplifier circuit (Q14, Q7 and Q8). The resulting signal will pass through a high-frequency antenna switch (D8), a low pass filter before being transmitted by the antenna.

The output power is about 500mW with 4.5V DC supply at battery terminal.

■ Low Pass Filter Circuit

A three-stage low-pass filter is located between the antenna and the antenna switch circuit. It helps to remove the harmonic components that is generated by transmission circuit.

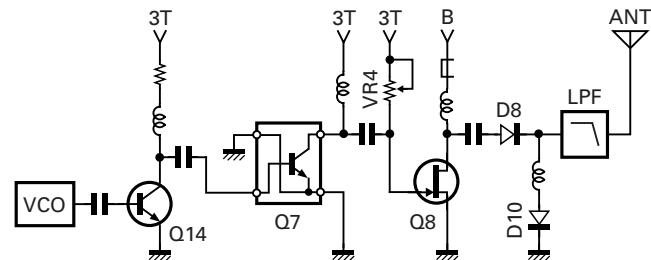

Fig. 9 Transmission output circuit

PLL System

■ VCO Circuit

The VCO circuit is housed in a shielding case.

The VCO circuit consists of a oscillation transistor (Q2), a variable capacitor diode (D2) for frequency control, a variable capacitor diode (D3) for variable reactance modulation, transmit/receive frequency switch diode (D1), control switch (Q1), ripple filter (Q3) and buffer amplifier (Q4).

The oscillation frequency is mainly determined by C12, C13, D2 and L3 (TX) or L3 and L2 (RX). D3 is used for modulation.

In RX mode, the TX/RX switch line goes low; switch Q1 and D1 turn off. The inductor L2 will be connected to oscillation circuit and Q2 will produce the first local frequency for reception purpose. (Receiving channel frequency subtracted by 21.7MHz equals to the receive frequency.)

In TX mode, the TX/RX switch line goes high; switch Q1 and D1 turn on. The inductor L2 is bypassed to ground through C2, D1 and C3. Q2 oscillation frequency becomes about 446MHz and the VCO will output the frequency which is needed for transmission.

The ripple filter (Q3) produces a 2.4V voltage supply for the oscillation transistor (Q2). D4 is used for speeding up the ripple filter operation when 3C line turns on.

CIRCUIT DESCRIPTION

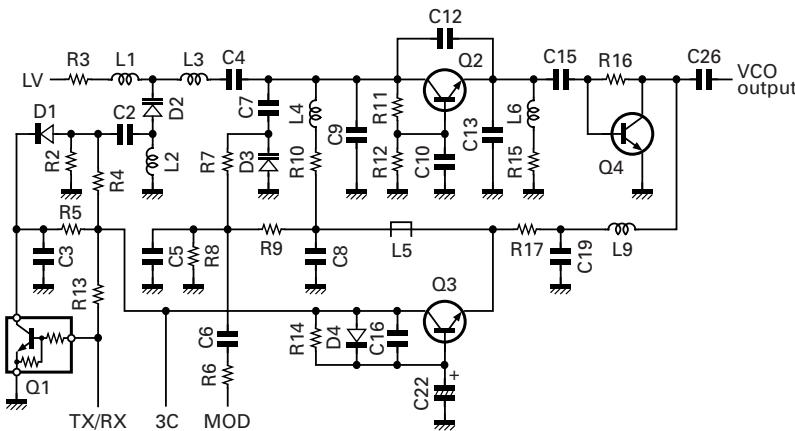

Fig. 10 VCO circuit

■ PLL Circuit

Frequency data is sent to the PLL IC (IC1) from MPU (IC208) through common data line either when the set is powered on, or when channel is changed, or when transmit is required. This data sets the dividers and CP (Charge Pump) of PLL IC.

The TCXO (X1) produces a 21.25MHz reference frequency and passes to PLL IC. Reference frequency is divided to produce a 12.5kHz for comparison of frequency inside PLL IC. The VCO output frequency is also passed to the PLL IC via Fin. The divider of the PLL IC, which is set by MPU, also divides this frequency. These two frequencies will be compared by the phase comparator circuit of PLL IC so as to detect the phase difference.

From the phase detection results, charge pump will be able to output the PWM (Pulse Width Modulation) pulse. This output voltage will then be used to control the VCO frequency through PLL Loop Filter.

This control voltage passes through the loop filter which is applied at the VCO control pin to control the oscillation frequency. Basically, the loop filter removes unwanted harmonics and noise produced at the output of the charge pump. It also determines the PLL response by synchronizing the amplitude and phase characteristics.

■ Unlock Detection Circuit

If the PLL cannot synchronize for some reason during operation, the PLL IC will output a low voltage level signal at LD (pin 5) to the MPU. MPU will stop transmitting or receiving to prevent wrong frequency transmitted or received.

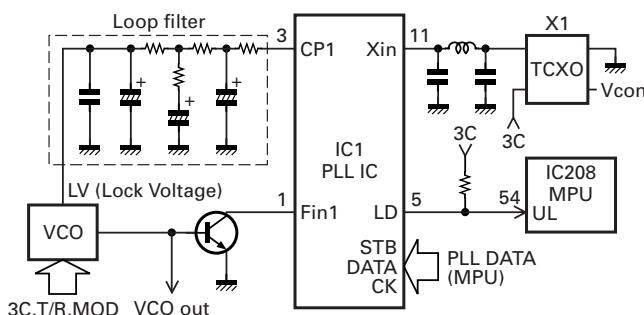

Fig. 11 PLL circuit

Control System

■ Reset Circuit

When a battery is inserted, the MPU power supply provides the operating voltage after about 0.5sec. The reset IC (IC202) output a low signal to reset the MPU so that MPU starts to work correctly.

When battery voltage is lower than 3.0V (set working voltage limits) or battery is removed, another reset IC (IC206) will send a reset to MPU so as to prevent this unit from working under non-guarantee low voltage condition.

■ Battery Voltage Indication Circuit

The unit contains a battery voltage detection circuit. This circuit monitors battery voltage every half second and displays bars on LCD to indicate the battery level. Once battery voltage drops below 3.2V, indicator will start flashing on LCD and TX operation inhibits.

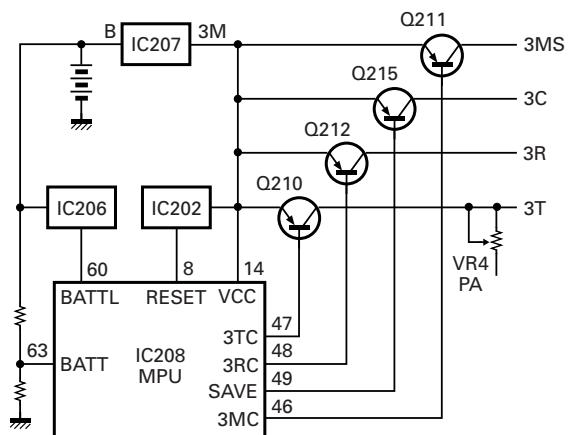

Fig. 12 Reset, battery voltage indication and Power supply circuit

CIRCUIT DESCRIPTION

■ Power Supply Circuit

The battery voltage directly supplies RF final amplifier (Q8) and AF amplifier (IC203) through AVR (Q216).

IC207 supplies 3V voltage to MPU, EEPROM and power key.

Switch Q211 delivers 3V supply 3MS to base band IC, MIC amplifier and VOX circuit when necessary.

Switch Q215 delivers 3V supply 3C to VCO and PLL circuit during receiving, transmitting or standby.

Switch Q212 delivers 3V supply 3R to FM IC, Mixer, RX amplifier and IF amplifier during receiving or standby.

Switch Q210 delivers 3V supply 3T to TX amplifier Q14, Q7, TX/RX switch and the power control circuit of Q8.

If there is no incoming signal or key press after 5 second, unit will enter its power save mode. In power save mode, 3C and 3R will be turned on and off respectively for power saving.

■ Remote Control Circuit

The voltage at the MPU REM (pin 3) will be converted into a digital signal to carry out remote operation according to the predetermined voltages level.

The REM pin is set to about 3V by pull up resistor. When remote control switch is pressed, the voltage divided by the resistor in series with the pull up resistor will generate a voltage for MPU to recognize the operation.

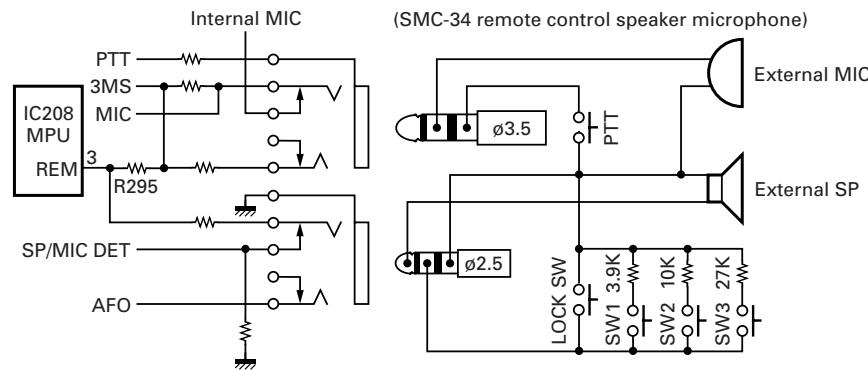

Fig. 13 Speaker, microphone jack and Remote control circuit

■ CTCSS Circuit

The tone frequency is generated by MPU (pin 57). This PWM signal becomes a sinusoidal waveform after passing through a RC low pass network. It will mix with voice signal from base band IC and becomes modulation signal for VCO.

During receiving, the QT signal received from FM IC will go through the base band IC so that signal with less than

300Hz will be output via IC209 pin 21. Next, it will pass through the low pass filter (IC211) so as to eliminate unwanted noise. Then the filtered tone will be passed to the pin 64 of MPU where the digital filter inside the MPU will detect the tone. If the tone is matched, MPU will turn on the speaker.

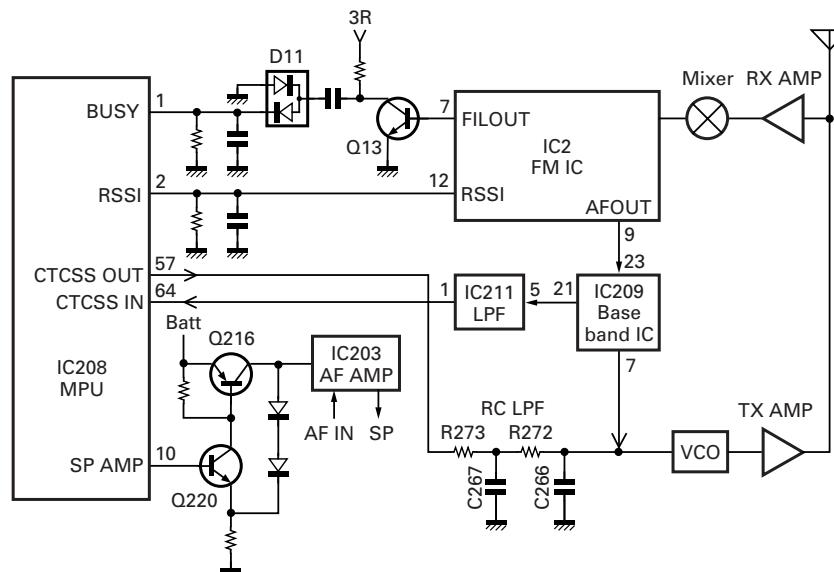

Fig. 14 CTCSS circuit

COMPONENTS DESCRIPTION / TERMINAL FUNCTION

TX-RX Unit (X57-6672-70) (A/2) : Control

Ref. No.	Use/Function	Operation/Condition/Compatibility
Q200	MIC Mute Switch	On when microphone mute
Q201	VOX Amplifier	
Q210	3T Switch	3T (3.0V)
Q211	3MS Switch	3MS (3.0V)
Q212	3R Switch	3R (3.0V)
Q213	Lamp LED switch	On when lamp LED on
Q215	3C Switch	3C (3.0V)
Q216	AF Amplifier AVR	Acts as a voltage regulator
Q217~219	AF Switch	Internal/external speaker switch
Q220	AF Switch	Acts as a voltage regulator
IC202	Voltage Detection	2.4V, MPU reset
IC203	AF Amplifier	2 pin : Input, 5 pin : Output 1, 8 pin : Output 2
IC204	MIC Amplifier	3 pin : Input, 4 pin : Output
IC206	Voltage Detection	3.0V, MPU reset
IC207	AVR	3M (3.0V)
IC208	MPU	
IC209	Baseband IC	Audio signal processing
IC210	EEPROM	Operating data storage
IC211	Low Pass Filter	CTCSS low pass filter
D200	Protection Diode	
D202	MIC Mute Diode	Acts as an OR gate
D203	Tone Signal Detection	Rectification
D204	Tone Signal Detection	Rectification
D205	Lamp LED	LCD back light illumination
D206	Protection Diode	
D208	Tone Signal Detection	Rectification
D209,210	Voltage Level Shift Diode	Acts as a zener diode

TX-RX Unit (X57-6672-70) (B/2) : RF

Ref. No.	Use/Function	Operation/Condition/Compatibility
Q1	Switch	Off when RX
Q2	Oscillator	RX : 424.30625~424.39375MHz TX : 446.00625~446.09375MHz
Q3	Ripple Filter	
Q4,5	Buffer

Parts with the exploded numbers larger than 700 are not supplied.

PACKING

ADJUSTMENT

Required Test Equipment

1. DC V.M and Tester (DVM)

1) High input impedance

2. RF VTVM (RF V.M)

- 1) Input impedance : $1M\Omega$ min., $2pF$ max.
- 2) Voltage range : F.S = $10mV$ to $300V$
- 3) Frequency range : $500MHz$ or more

3. Frequency Counter (f. counter)

- 1) Input sensitivity : Approx. $500mV$
- 2) Frequency range : $500MHz$ or more
- 3) Measurement stability : $0.2ppm$ or less

4. DC Power Supply

- 1) Voltage : $0V$ to $10V$, variable
- 2) Current : Approx. $1A$

5. Power Meter

- 1) Measurement range : Approx. $1W$
- 2) Input impedance : 50Ω
- 3) Frequency range : $500MHz$ or more

6. AF VTVM (AF V.M)

- 1) Input impedance : $1M\Omega$ or more
- 2) Voltage range : F.S = $1mV$ to $3V$
- 2) Frequency range : $50Hz$ to $10kHz$

7. AF Generator (AG)

- 1) Output frequency : $100Hz$ to $10kHz$
- 2) Output voltage : $0.5mV$ to $1V$

8. Linear Detector or Deviation meter

- 1) Frequency range : $500MHz$ or more

9. Distortion Meter

- 1) Frequency range : $30Hz$ to $100kHz$
- 2) Input level : $50mV$ to $10Vrms$
- 3) Measurement stability : 3% or less at $1kHz$

10. SSG

- 1) Frequency range : 30 to $500MHz$
- 2) Modulation : FM
- 3) Output level : $-133dBm$ ($0.05\mu V$) to $-13dBm$ ($50.1mV$)

11. Oscilloscope

- 1) Measurement range : DC to $30MHz$

12. Dummy Load

- 1) 8Ω , $1W$

Setting

- 1. Power voltage : DC $4.5V$
Current protection : Approx. $300mA$

- 2. Frequency

- Channel frequency (12.5kHz step) (MHz)

Channel	TX frequency	RX frequency
1	446.00625	446.00625
2	446.01875	446.01875
3	446.03125	446.03125
4	446.04375	446.04375
5	446.05625	446.05625
6	446.06875	446.06875
7	446.08125	446.08125
8	446.09375	446.09375

- Tone frequency (Hz)

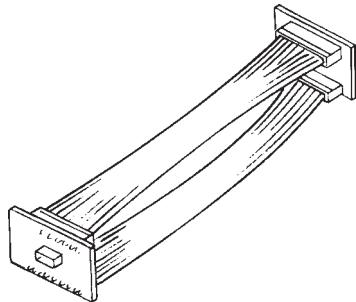

No.	Frequency	No.	Frequency	No.	Frequency
1	67.0	14	107.2	27	167.9
2	71.9	15	110.9	28	173.8
3	74.4	16	114.8	29	179.9
4	77.0	17	118.8	30	186.2
5	79.7	18	123.0	31	192.8
6	82.5	19	127.3	32	203.5
7	85.4	20	131.8	33	210.7
8	88.5	21	136.5	34	218.1
9	91.5	22	141.3	35	225.7
10	94.8	23	146.2	36	233.6
11	97.4	24	151.4	37	241.8
12	100.0	25	156.7	38	250.3
13	103.5	26	162.2		

- 3. SSG standard modulation
(Mod : $1kHz$, DEV : $\pm 1.5kHz$)

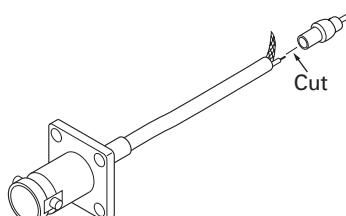

ADJUSTMENT

Jigs

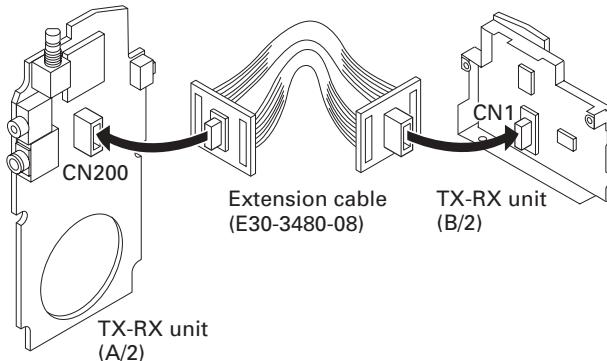

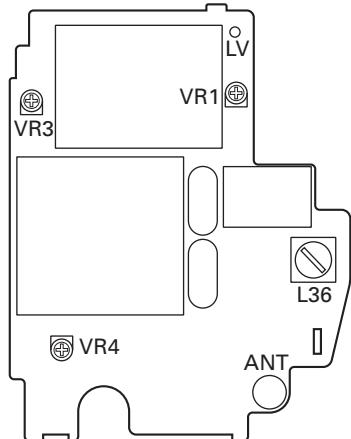

Use jigs for repair or adjustment.

■ Extension Cable (E30-3480-08)**■ ANT Cable (E30-3418-05)**

Modify the cable as shown below.

**■ Connection Jigs**

Connect the extension cable as shown in the illustration below.

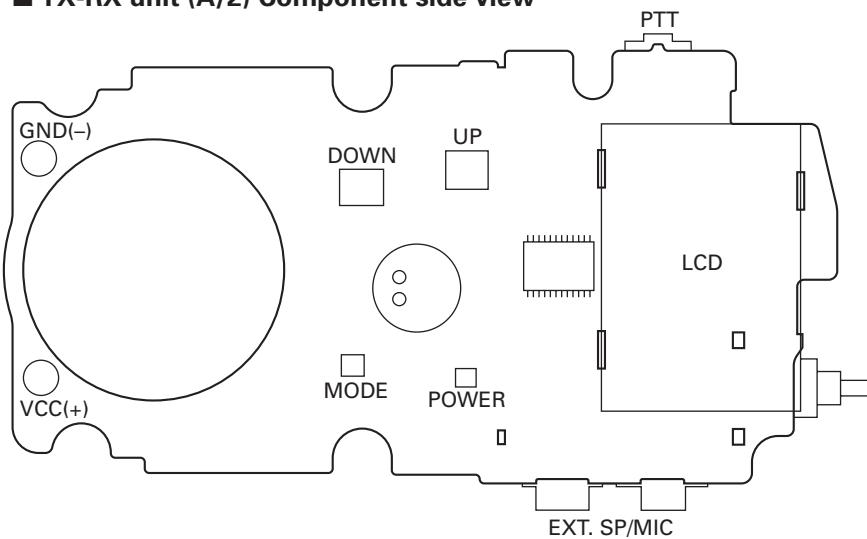

**Adjustment Points****■ TX-RX unit (B/2)
Component side view**

VR1 : MAX deviation

VR3 : Reference oscillator frequency

VR4 : TX power adjustment

L36 : Quad coil adjustment

■ TX-RX unit (A/2) Component side view

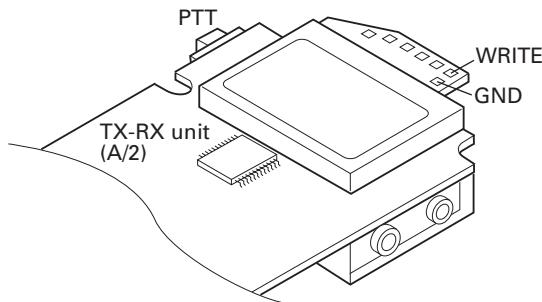

LV : VCO lock voltage terminal

VCC (+), GND (-) : External power supply terminal (Fasten it with an alligator clip.)

ADJUSTMENT

Adjustment Mode

■ Storing the Adjustment Value for the CTCSS Deviation, Battery Voltage Detection, Busy (Squelch) Detection and VOX Gain Level

■ How to Store the Adjustment Value to the IC210 (EEPROM) on the TX-RX Unit (A/2)

If the adjustment data in IC210 is corrupted or the IC itself is replaced for servicing, all the data must be re-adjusted and stored as follows.

1. Turn the transceiver OFF.
2. Enter the adjustment mode by shorting the "WRITE" and "GND" terminals, then press the [PTT] key and turn the transceiver ON. After turning the transceiver ON, remove the wire from the "WRITE" and "GND" terminals.
Note : You must preset the tone number to "24"(151.4Hz) at the required channel prior to enter the adjustment mode.
Otherwise, you cannot perform the "CTCSS Deviation" adjustment.
3. The adjustment menu appears. It begins with "CTCSS Deviation" adjustment.
4. The adjustment menu changes when you press the [UP] or [DOWN] key.
5. Press the [MODE] key to enter the selected adjustment menu. The adjustment value appears on the LCD and blinks.

6. Adjust the value according to the instructions on each item (Refer to "Adjustment instructions").
7. After adjusting the data value, press the [PTT] key to store the new data to the EEPROM (IC210). If you do not wish to store the adjusted data value to EEPROM (IC210), press the [MODE] key. No data will not be stored to the EEPROM (IC210) and the old data is retained.
8. You can press the [REM1] key on the speaker-microphone (if connected) to activate the Monitor function. (Please disable the monitor function in the Battery voltage detection menu.) The adjustment menu can be up or down by pressing the [REM2] or [REM3] key.
9. To exit "Adjustment mode", turn the transceiver OFF.

Note : Refer to the diagram on the page 18 to understand how each adjustment can be performed.

■ Adjustment Instructions

• CTCSS Deviation adjustment

1. After entering the CTCSS Deviation adjustment mode, select the values with [UP]/[DOWN] keys. Then press [PTT] key to write the new value to the EEPROM (IC210).
2. Press [PTT] keys again to transmit. Confirm the CTCSS deviation is 0.35kHz. If the deviation is not 0.35kHz, perform step 1 again to select different value, then measure the deviation.
3. Perform step 1 and 2 until you get the deviation value 0.35kHz.

• Battery voltage detection adjustment

Set the DC power supply voltage to 3.20V and connect the cable to the transceiver.

• Busy (Squelch) detection adjustment

Set your SSG (Synthesized Signal Generator) values as follows.

Frequency : 446.00625MHz (CH1)

Modulation frequency : 1kHz

Frequency deviation : 1.5kHz

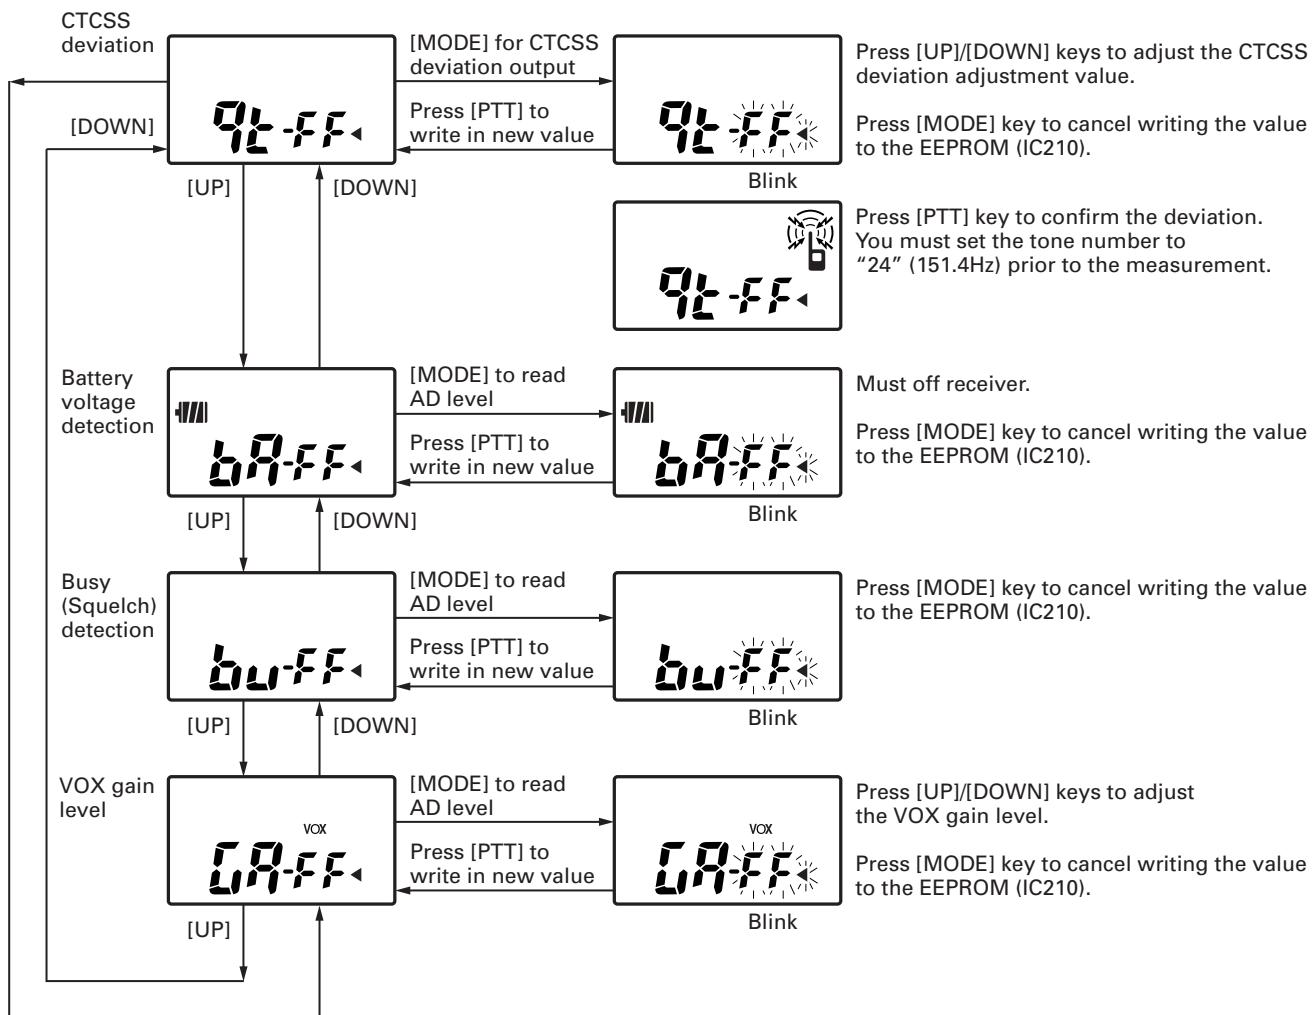

Signal output : -123dBm (0.158μV)

• VOX gain level adjustment

Set the initial VOX gain value to 3C (in hexadecimal).

ADJUSTMENT

■ Adjustment Mode Flow Chart

**Note :**

- PLL unlock status is not examined while in Adjustment Mode.
- The transmission time is not limited in Adjustment Mode.
- The lamp function is not available in Adjustment Mode.
- The Key Lock function forces the transceiver to exit Adjustment Mode.
- You cannot set the Beep function OFF while in Adjustment Mode (the transceiver always beeps).

ADJUSTMENT**PLL Section**

Item	Condition	Measurement			Adjustment			Specifications/Remarks
		Test-equipment	Unit	Terminal	Unit	Parts	Method	
1. VCO lock voltage RX	1) 4CH : 446.04375MHz	DVM	TX-RX (B/2)	LV			Check	0.7~2.7V

LEVEL DIAGRAM

Transmitter Section

Microphone input : 1kHz, 5.0mVrms, 1.5kHz DEV
AF : Measurements are taken by AF VTVM
RF : Measurements are taken by RF VTVM

Receiver Section

Each of the levels plotted from the RF to IF is the level which can provide 20dB SINAD for an SSG through 4700pF ceramic capacitor.
The AF level is the value measured by an AF VTVM when an SSG signal of -53dBm is received and the AF output is adjusted to 0.63V using AF VOL.

UBC-4 (BATTERY CHARGER) / UPB-1 (BATTERY PACK)**UBC-4 External View****UPB-1 External View****UBC-4 Specifications**

Usable temperature range 5°C~40°C
 Supply voltage (AC adapter) AC 230V
 Charging current Approx. 150mA
 DC input voltage Approx. 9V
 Charging time UPB-1 : Approx. 8 hours
 Weight (Charger only) 70g
