Supplement to RSS User's Guide 68-81074C50-K

GENERAL

This supplement outlines changes that have occurred since the printing of Radio Service Software User's Guide 68-81074C50-K. Implementation of this information in earlier manuals is not necessary.

DETAILS

Received Signal Strength Indication (RSSI) information is being added to the RSS.

On page 4-16, in the RECEIVER ALIGNMENT MENU, the description for F9 should read:
RSSI Alignment

On page 4-17, the following information is added:

F9 - Received Signal Strength Indication (RSSI) This alignment procedure tunes the Received Signal Strength Indication.

A new page (**4.2.2.8 RSSI ALIGNMENT**) is being added to the manual. A copy of the new page is on the back side of this supplement.

Refer to your Radio Service Manual for the RSSI Alignment procedure. This alignment procedure tunes the Received Signal Strength Indication (that is, strength of the RSSI value for the current signal) for RSSI rated audio power across the radio. It should be performed at -100dbm injection.

This procedure should be attempted only by qualified service personnel. Failure to perform alignment procedures properly may result in seriously degraded radio or system performance.

PROGRAMMING PROCEDURE:

1. Press **F4** to read the RSSI value. Repeat this step three times to obtain an accurate reading.
2. Use up/down arrow keys to set the "New Softpot Value" field equal to the "RSSI" value read in step 1.
3. Program the radio with the new RSSI value by pressing **F8**.

FUNCTION KEY DESCRIPTIONS:

F4 - READ RSSI reads the Received Signal Strength Indication (that is, the strength of the RSSI value for the current signal).

F8 - PROGRAM VALUE programs the selected value into the radio.

FIELD DEFINITION:**RSSI (Received Signal Strength Indication)**

Refers to the strength of the RSSI value for the current signal. In the RSSI sampling scheme, RSSI values are separated into four levels: poor, acceptable, good and excellent. The value in this field specifies the poor/acceptable boundary and may range between 0 and 127.

The default is 0 (zero).

New Softpot Value

This is the softpot value for this frequency. The status bar shows the relationship between this setting and the minimum and maximum settings.
