FOREWORD

1. SCOPE OF MANUAL

This manual contains information for the installation, operation, and maintenance of the Communications System Analyzer.

2. PURPOSE AND USE

The Motorola Communications System Analyzer is a portable test instrument, designed specifically for the service and monitoring of communications equipment. Its functions supersede those of a Service Monitor, expanding the features and capabilities to the point wherein servicing is achieved with a single instrument, rather than a host of separate equipment.

The R2001C is the standard Communications System Analyzer. The R2002C Analyzer, which contains the IEEE-488 Standard interface control bus, is also available. Programming for the R2002C is covered in Section 21 of this manual.

The Analyzer improves a technician's efficiency and accuracy and reduces servicing time.

The Communications System Analyzer performs the functions of signal generation, signal monitoring and the tests normally associated with the devices listed below.

- Spectrum Analyzer
- Duplex Generator
- Modulation Oscilloscope
- Frequency Counter
- AC/DC Digital Voltmeter
- RF Wattmeter
- General Purpose Oscilloscope
- Multi-Mode Code Synthesizer
- Distortion/SINAD Meter
- Sweep Generator

The Analyzer meets the shock and vibration requirements of EIA test RS152B, the same specifications met by Motorola mobile radios. This minimizes failure when the instrument is used in a mobile service van, and means it is as tough as the radios it services.

The Communications System Analyzer is designed to be serviced quickly and easily, should a breakdown occur. The majority of the circuitry is on twelve modular plug-in circuit boards which have built-in test points that aid in isolating the problem to a specific board. Simple plug-in replacement gets the instrument back in service.

CAUTION

This equipment contains parts that are subject to damage by static electricity. Proper precautions should be taken during handling.

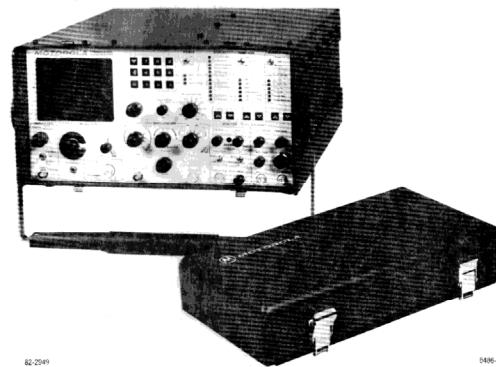

WARNING

Lithium Battery
The processor module within this system utilizes a lithium battery as a memory keep-alive voltage source. Do not handle or dispose of the battery near heat, open flame, or any other active material that burns in the presence of water or high humidity. Do not put the battery in fire, attempt to charge, heat above 100°C, or solder directly to the cell. Do not overdischarge the cell to a reverse voltage greater than 3 volts. The battery may burst and burn or release hazardous materials. See section 5-143 of this manual for battery troubleshooting procedures and cautions.

CAUTION

Lithium Battery

Lithium batteries are classified as hazardous materials and must be disposed of accordingly. Do not dispose of the battery by placing it in with the everyday trash. Consult state and local codes for the appropriate disposal procedure. Motorola will dispose of the battery if the expended battery is returned in the replacement battery container and by the same method that the new battery came to you, send to: Motorola Inc., Return Goods Department, 1313 East Algonquin Road, Schaumburg, Ill. 60196.

SECTION 1

I-1. INTRODUCTION

I-2. This section lists the physical, electrical, and input/output characteristics of the Communications System Analyzer shown in figure I-1.

Table 1-1. Physical Characteristics

Characteristics	Description
Length	20.75 inches (52.7 cm)
Width	15.75 inches (40.0 cm)
Height	8.25 inches (21.0 cm)
Weight	46 pounds (21.9 kg) (Excluding Battery Pack)

Table 1-2. Electrical Characteristics

Characteristics	Description
Signal Generator Mode	
Frequency	
Range:	10 kHz to 999,999 MHz
Resolution:	100 Hz
Accuracy:	Equal to master oscillator time base
Output (into 50 ohms)	
Attenuator:	16 dB variable plus 10 dB steps over 13 ranges
Range:	0.1 V to 1 V rms (-127 dBm to +13 dBm)
Accuracy:	± 2 dB accuracy on 0 dB step attenuator range ± 2 dB across other step attenuator ranges ± 1 dB over temperature range
Spectral purity	
Spurious:	≤ -40 dB
Harmonics:	≤ -15 dB
Frequency modulation	
Range:	0 - 50 kHz peak
Accuracy:	± 5% of full scale
FM residual noise:	100 Hz
External/internal frequency range:	5 Hz - 10 kHz (± 1 dB)
External input:	Approximately 150 mV for 20 kHz deviation
Modes:	Internal, external, microphone or all simultaneously

1-1

Table 1-2. Electrical Characteristics (Cont)

Characteristics	Description
General Spectrum Analyzer	
Dynamic range	>75 dB displayed, -105 dBm to -30 dBm input range with step attenuator
Frequency	
Range:	4 MHz to 1,000 MHz
Full scale frequency dispersion:	Adjustable between 1 MHz and 10 MHz
Duplex Generator	
Frequency offset	Adjustable from 0 to 10 MHz plus fixed offset of 45 MHz (high or low side)
Modulation level (FM only)	Adjustable from 0 to 20 kHz peak deviation
Oscilloscope	
Size	8 cm × 10 cm
Frequency response	DC to 0.5 MHz (3 dB point)
External vertical input range	10 mV, 100 mV, 1V, 10V (per division)
Sweep rates	100 ns/div, 1 μs/div, 10 μs/div, 100 μs/div
Sync	Automatic, normal and delayed triggering. Delayed triggering is programmable to 10 seconds in 1 ms steps and works in conjunction with the code synthesizer. See "CAUTION note on page 4-19"
Frequency Counter	
Frequency range	10 Hz to 35 MHz
Readout:	5 digit, autoranging
Input sensitivity:	30 mV from 10 Hz to 1 MHz 50 mV from 1 MHz to 35 MHz
Digital Voltmeter	
Readout:	Auto ranging digital display, 1, 10, 100, 300 volts full scale. AC-dBm calibrated across 600 ohms.
DC accuracy:	± 1% of full scale ± 1 least significant digit
AC accuracy:	± 2% of full scale
AC bandwidth:	50 Hz to 10 kHz
Modulation Source	
Code Synthesizer	
Frequency range:	5 Hz to 9,999.9 kHz sinewave
Resolution:	0.1 Hz
Frequency accuracy:	± 0.01%
Distortion:	<1%

1-3

Table 1-2. Electrical Characteristics (Cont)

Characteristics	Description
Amplitude modulation	
Range:	0 to 80% from 1 to 500 MHz
Accuracy:	± 10% of full scale from 0% to 50% AM
External/internal frequency range:	5 Hz - 10 kHz (± 1 dB)
Modes:	Internal, external, microphone or all simultaneously
Double sideband suppressed carrier	
Carrier suppression:	>25 dB (1 MHz - 500 MHz)
Monitor Mode	
Frequency	
Range:	1 MHz to 999,999 MHz
Resolution:	100 Hz
Accuracy:	Equal to that of master oscillator time base
Frequency error indicator	Autoranging CRT display. ± 10 Hz resolution for frequency error measurements on 1.5 kHz, 5 kHz and 15 kHz full scale ranges. ± 1 Hz resolution on the 50 Hz full scale range.
Input sensitivity	1.5 μV for 10 dB EIA Sinad (narrow band) ± 6 kHz mod. acceptance 7 μV for 10 dB EIA Sinad (wide band) ± 10 kHz mod. acceptance 4 MHz to 1000 MHz. Useable to 1 MHz.
Spurious response	-40 dB typical 0 dB image at +21.4 MHz -10 dB at L.O. harmonics ± 10.7 MHz
Deviation Measurement	
Range:	1, 10, 100 kHz full scale
Accuracy:	± 5% of reading. 100 kHz from 500 Hz to 50 kHz deviation; 10 kHz - 100 kHz from 50 kHz to 75 kHz deviation.
Peak deviation limit alarm:	Set via keyboard to 100 Hz resolution (0.1 kHz to 99.9 kHz). Audible alarm indicates limit condition in all Monitor Modes. 00.0 setting disables the alarm.
AM modulation measurement	
Range:	0 to 100%
Accuracy:	± 5% of full scale
RF Wattmeter (Autoranging display)	
Frequency range:	1 MHz to 1000 MHz
Power range:	1.0 watts to 125 watts
Accuracy:	± 10%, 1 watt to 125 watts
Protection:	Over temp indicator

1-4

Table 1-2. Electrical Characteristics (Cont)

Characteristics	Description
CCIR (100 ms)	Tone length - 100 ms Digit Frequencies 1 - 1124 Hz 2 - 1197 Hz 3 - 1275 Hz 4 - 1358 Hz 5 - 1442 Hz 6 - 1540 Hz 7 - 1640 Hz 8 - 1747 Hz 9 - 1860 Hz 0 - 1981 Hz R - 2110 Hz
CCIR (70 ms)	Tone length - 70 ms
EEA	Digit Frequencies Same as CCIR (100 ms)
Tone remote access	Tone length - 40 ms Digit Frequencies Same as CCIR
Digital private line (DPL) Fixed 1 kHz	Remote base access sequence as follows Tone A for 150 msec Tone B for 40 msec 10 dB below Tone A Tone A continuously 30 dB below the first Tone A burst Codes 000 to 777 and inverted
External input Microphone: External Jack Frequency range: level: Impedance:	Equal to master time base <1%
Code synthesizer external output level	Standard RTM 4000A microphone interface with IDC.
Distortion/SINAD Meter	
Input Frequency: .	1 kHz = 1 Hz
Input level range:	0.5V to 10 Vrms
Sinad accuracy:	± 1 dB at 12 dB Sinad
Distortion Accuracy:	± 0.5% of Distortion for 1% < THD < 10% ± 1% of Distortion for 10% ≤ THD ≤ 20%

Table 1-2. Electrical Characteristics (Cont)

Characteristics	Description
Manual Frequency Scan	
Step size	Switch Selectable: 100 Hz, 1kHz, 10kHz, 100kHz and 1 MHz (+ or -)
Step rate	5 steps/sec
Time Base	
Standard TCXO	Aging: $\pm 1 \times 10^{-9}$ per year Temp: $\pm 1 \times 10^{-3}$ maximum error over the 0° to 55°C temp range
Optional ovenized high stability	Aging: $\pm 1 \times 10^{-9}$ per year Temp: $\pm 5 \times 10^{-9}$ maximum error over the 0° to 55°C temp range (warmup to $\pm 5 \times 10^{-7}$ of final frequency within 20 minutes)
Power and Environmental	
AC	100-130 VAC, 200-260 VAC 47-63 Hz
DC	+11.5 VDC to + 16 VDC
Optional battery	13.6V battery - provides 1 hour continuous operation
Temperature range	0° to 55°C operation, -40° to 85°C storage

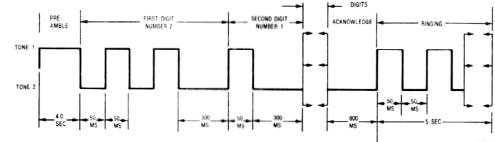

Figure 1-4 IMTS Sequence Timing

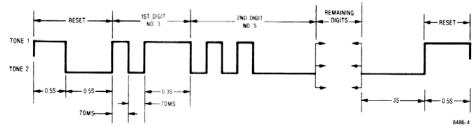

Figure 1-5. MTS Sequence Timing

1-7

1-8

Table 1-3. Input/Output Characteristics

Characteristic	Description
Input	
Ext Mod in	10K ohms nominal, 150 mV typical for 20 kHz dev. FM or 80% AM
Mic:	Mic input provides bias and IDC limiting suitable for Motorola RTM 9000A handset. PTT switches R2001 from monitor to transmitter.
Ext Horiz	1 volt minimum for full screen deflection. Maximum input 10 volts.
Vert/SIN/Dist/DVM/Counter In	1 Meg ohm, 40 nF of Nominal - 200 volts DC max, 300 VRms max at frequencies below 500 Hz, 10 VRms max up to 35 MHz <ul style="list-style-type: none"> • Scope vert in: DC to 500 Hz or 50 Hz to 500 kHz AC mode (± 3 dB) • Distortion/Sinusoidal: 0.5 to 10 VRms in at 1 kHz • DVM in: 1, 10, 100 and 3000 full scale AC (true RMS) or DC. AC bandwidth 50 Hz to 10 kHz for $\pm 5\%$ F.S. accuracy (DC range includes across 800 ohms) • Frequency counter in: 30 MHz or greater required from 10 Hz to 1 MHz; 50 Mv or greater required from 1 MHz to 35 MHz 50 ohms nominal, 125 watts max (1-1000 MHz)
RF In/Out	
CAUTION:	
Ext Wattmeter	The RF In/Out Jack is protected against RF overload. However, to prevent undue stress on the protected circuits it is advisable to always switch the system to the power monitor mode before applying power in excess of 200 mW. Additional protection is also obtained by making it a practice not to leave the step attenuator in the 0 dB position.
10 MHz std in (rear panel)	Characteristics suitable for Motorola ST-1200 series Wattmeter Elements 70 to 350 mV rms input required at 10 MHz, impedance greater than 50 ohms.

Table 1-3. Input/Output Characteristics (Cont)

Characteristic	Description
Output	
Mod out	Up to 11 vpp into 600 ohms 10 Hz to 10 kHz
Demod out	Typically 3 vpp into 600 ohms for ± 5 kHz deviation narrowband, 4 vpp for ± 75 kHz deviation wideband. DC to 10 kHz response
RF in/out	1.0 Vrms (+13 dBm) to 0.1 μ Vrms (-127 dBm) 50 ohm nominal source impedance. 10 kHz to 1.0 GHz.
Duplex gen out	-30 dBm typical, 50 ohm nominal source impedance 2 MHz to 1 GHz
10 MHz std out (rear panel)	250 mV rms nominal output into 50 ohms

SECTION 2 DESCRIPTION

2-1. DESCRIPTION

2-2. The Communication System Analyzer is a portable test instrument designed for servicing and monitoring of portable, mobile, and land base communications equipment operating over the frequency range of 1 MHz to 1 GHz. The unit performs the functions of signal generation, frequency error and modulation measurement. It is also capable of a variety of tests normally associated with the following devices:

- Spectrum analyzer
- Duplex offset generator
- Modulation oscilloscope
- Frequency counter
- AC/DC digital-analog voltmeter
- RF wattmeter
- General purpose oscilloscope
- Multi-mode code synthesizer
- Distortion/SINAD meter
- Sweep generator

2-3 **MICROPROCESSOR.** A Motorola M-6800 series microprocessor permits keyboard entry of data, autoranging of displays, fast frequency access, and permanent storage of often-used frequencies and codes. Generate and monitor RF frequencies, tone codes, and timing sequences can be programmed into a nonvolatile memory, saving time and eliminating entry errors. When one particular type of equipment is continuously serviced, the unit can be programmed to select the mode of operation required when first turned on.

2-4. **DISPLAY.** All functions, generated or monitored, are presented on an 8 cm x 10 cm cathode ray tube (CRT) in both analog and digital format, with the name of the function being displayed. The CRT also displays control settings eliminating the need for operator search of different equipment panels. Digital readouts are visually aided by the use of the continuously autoranging analog line segments, which are similar to a bar graph. Each has a base line and calibration markers, in addition to the intensified segment showing the measurement. The user selectable displays are listed in a column beneath the DISPLAY heading on the front panel. Choosing a display is accomplished by pressing an arrow button below the column, for up or down movement, as required. When the appropriate arrow is pressed, the LED adjacent to the selected display illuminates. FUNCTION is selected in the same way, providing rapid, accurate changes in service capability at the touch of a button.

2-5. **SYSTEM WARNINGS.** To aid the technician in servicing, visual warnings will appear on the CRT when certain overload or caution conditions exist. Displays warn of low battery power, overheating of the RF load, or an improper attenuator setting for particular measurements. In addition, a continuous audible alarm sounds when a preset deviation limit is exceeded in monitor modes. This limit is entered by using the keyboard and may be programmed from 0.1 KHz to 99.9 kHz, with 100 Hz resolution.

- 2-23. Power Supply.** The Communications System Analyzer may be powered by a variety of sources:
- AC at 110 or 220 Volts, 50, 60 Hz
 - DC from an external 12 Volt source such as a service vehicle
 - DC from an optional battery pack. Servicing can thus be accomplished wherever the equipment under test is located.

2-24. ACCESSORIES.

2-25. Figure 2-1 illustrates and Table 2-1 lists the accessories supplied with the Communication System Analyzer. Optional equipment available for use with the unit is listed in Table 2-2.

Figure 2-1. Accessories Supplied with Analyzer

2-4

Table 2-1. Accessories Supplied with the Communication Systems Analyzer

Equipment	Motorola Part No.	Use
Front cover	15-80335A70	Front panel and CRT protection, storage of cables, power cord, and other equipment for on-site servicing.
Sun shade	15-80335A55	Snap over CRT during use in bright sunlight.
Power cord	30-80336A36	Three conductor cord to supply AC power to unit. Also used when charging optional battery pack.
Oscilloscope probe	RTL-4058A	A X1 probe with attachments for general servicing.
In-line wattmeter adapter	RTL-4055B	Allows use of Motorola ST-1200 series in-line wattmeter elements for direct measurement and display of forward and reflected transmitted power.
Coax adapter	58-84300A98	Adapts front panel "N" connector to BNC female.
Antenna	TEKA-24A	Plugs into RF in/out connector on front panel, with N to RPT-2 adapter. Used for off-the-air transmitter and receiver tests.
Test microphone	RTM-4000A	Used for voice modulation of signals.
Connector kit	RPX-4097A	Contains four male and four female connector pins. Used to fabricate a mating plug for male dc power connector at back of analyzer. Enables user to make a dc power cable to interconnect separate power source to analyzer. Pins 1 and 2 are positive, pin 3 is the charging line, pin 4 is ground.

Table 2-2. Optional Equipment for Use with Analyzer

Equipment	Motorola Part No.	Use
IEEE-488 Standard interface bus option	Consult factory for retrofit information.	Enables fully automatic testing with the unit by external control from a computer or programmable controller.
Battery pack	RTP-1002A	13.6 volt battery and charger attaches to back of the unit. Provides one hour of continuous operation. Cannot be used with IEEE-488 option.
High-stability oscillator module	RTL-1007A	Improves stability of the time base as specified in electrical characteristics section.
Protective cover	RTL-4056A	Padded fabric type cover to protect unit from excessive field wear.

2-5

SECTION 3 INSTALLATION

3-1. PACKING INFORMATION

3-2. The unit is packaged in a fiberboard carton and protected by foam pieces as shown in figure 3-1. The unit is first packed in a cardboard container and then this carton is packed in a second, larger cardboard container, for further protection. Save the packing container and materials for future use.

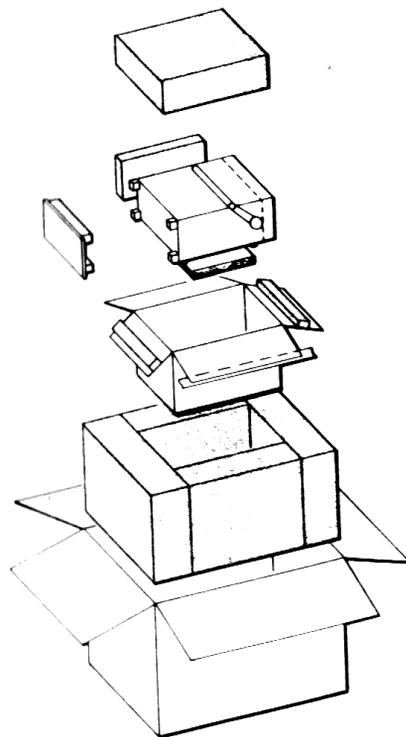

Figure 3-1. Typical Communication System Analyzer Packaging

3-3. All accessories supplied with the analyzer are packed in the analyzer cover.

3-4. INITIAL SETUP

3-5. **ANALYZER.** To set up the Analyzer for use, place the unit on workbench or in mobile repair unit. Remove the front cover by operating the two latches on the bottom of the cover. Lift the cover and slide it to the side to separate the hinges. Remove the power cord (AC or DC) that is stored in the cover. Attach the female connector of the power cord to the appropriate connector on the rear panel of the analyzer, and the other end to the power source. For AC power a grounded 3 wire power source of 100-130 Vac or 200-260 Vac, 47-63 Hz must be used.

NOTE

The unit is set for 110-130 Vac operation from the factory. For operation from 100-110 Vac or 200-260 Vac, the voltage selection card must be readjusted before connection to the power source. This is accomplished by the following procedure:

1. Remove the power cord from the rear panel connector.
2. Slide the selector card cover door over the connector area exposing the selection card and fuse area.
3. Pull outward on the fuse ejector tab and remove fuse.
4. Remove the printed circuit board voltage selector card by pulling straight to the rear.
5. Reinsert the card at the orientation which causes the appropriate voltage range (marked on card) to be displayed.
6. Install the proper fuse (1.5A for 100-130 VAC, 0.75A for 200-260 VAC).
7. Slide the cover plate back to the original position, connect power cord, and proceed with system operation.

Remove the accessories to be used from the cover. Move the POWER switch to the ON position. When the Oven Ready indicator illuminates the unit's frequency standard is stabilized and the unit is ready for use, (instantaneous with standard TCXO).

CAUTION

When installing the analyzer in a vehicle, the DC supply line should be fused close to the vehicle battery. The analyzer is protected against overload by the DC-8A fuse on the rear of the unit, but the vehicle is not protected.

3-6. BATTERY PACK. The battery pack is attached to the rear of the analyzer with two clips and two screws. Align and slide the mounting clips of the battery pack into the slots on the mounting brackets on the left side of the back panel of the analyzer. Align the captive screws with the mounting holes on the right of the panel and tighten. Connect the power plug to the connector at the top right of the rear panel.

SECTION 4 OPERATION

4-1. GENERAL

4-2. This section contains information for the operation of the Communication System Analyzer.

4-3. CONTROLS, INDICATORS, AND CONNECTORS

4-4. The analyzer controls, indicators, and connectors are shown in Figures 4-1 through 4-3 and listed with their functions in Table 4-1.

Table 4-1. Controls, Indicators, and Connectors

Item	Description	Function
FRONT PANEL (fig. 4-1)		
Keyboard	Twelve-key pushbutton keyboard	Enters variables into memory/enters manual variables/selects variables to be used from the memory.
▼	Line cursor key	Moves the cursor down to the next line that may be changed. Preset permanent entries are skipped. Cursor will move down only. When on last line, will return to top line with next entry.
◀	Horizontal cursor key	Moves the horizontal cursor left to the next entry position that may be changed. When in the last left position, the cursor will move to the far right with the next entry.
0 through 9	Numerical keys	Used to select from the memory a stored value to be used, or to enter directly a value to be used.
● Intensity ● Focus	Stacked concentric potentiometers ● Intensity - center (small) knob ● Focus - outside (large) knob	Controls the intensity of the scope presentation. Controls the focus of the scope presentation.
Dispr/Sweep control	Potentiometer	Controls the frequency span (1-10 MHz) displayed on the CRT when unit is used as a spectrum analyzer. Provides sweep width control when either sweep function (SWP 0.01-1 MHz or SWP 1-10 MHz) is selected.

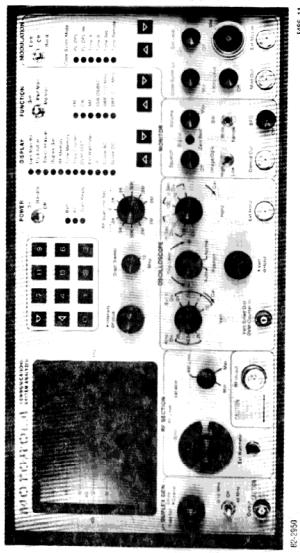

Figure 4-1 Controls, Indicators, and Connectors, Front Panel

4.2

Table 4-1. Controls, Indicators, and Connectors (Cont)

Item	Description	Function
FRONT PANEL (fig. 4-1)		
RF Scan (Hz/Sec) switch	Eleven position switch.	Allows automatic scan of the generated or the monitored frequency. The switch setting indicates rate of frequency change. The rate is 5 steps per second, with frequency steps of 100 Hz, 1 kHz, 10 kHz, 100 kHz and 1 MHz.
POWER switch	Three-position toggle switch.	<ul style="list-style-type: none"> a. Energizes all circuitry in the On position. b. At Standby position, removes DC from all circuitry except the frequency standard and battery charger. c. At Off, only the battery charging circuitry is operative if an ac power source is being used.
Batt indicator	LED (red)	Illuminates when equipment is using DC power.
AC indicator	LED (red)	Illuminates when equipment is connected to an ac power source. Position of POWER switch has no effect on indicator. Equipment automatically switches to ac power source when connected to ac line voltage.
Oven Ready indicator	LED (red)	Illuminates when optional frequency standard oven has stabilized. Continuously illuminated with the TCXO frequency standard.
DISPLAY indicators	Twelve LEDs (red)	<ul style="list-style-type: none"> a. Gen/Mon/MF — In the generate mode the center frequency, output power, and modulation depth of the RF output is displayed. In the monitor mode the center frequency, input power, frequency error, and modulation depth of the received carrier is displayed. b. Modulation — The modulation audio in the generate mode or the demodulated audio in the monitor mode is displayed. c. Spectr Analyzer — The spectrum analyzer mode is enabled. The RF spectrum and the operating center frequency is displayed.

4.4

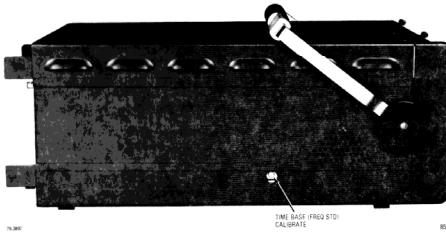

Figure 4-2 Controls, Indicators, and Connectors, Left Side Panel

4.3

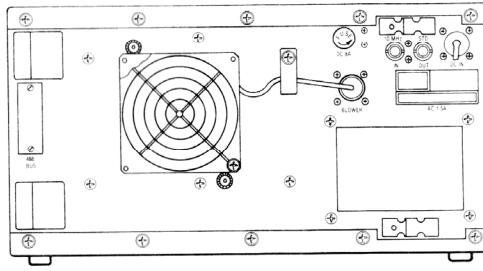

Figure 4-3 Controls, Indicators, and Connectors, Rear Panel

4.5

Table 4-1. Controls, Indicators, and Connectors (Cont)

Item	Description	Function
FRONT PANEL (fig. 4-1)		
FUNCTION switch	Three-position toggle switch	<ul style="list-style-type: none"> d. Duplex Gen — The duplex generate and monitor frequencies are displayed. The depth of modulation on the generate frequency and on the received carrier is indicated for the generate and monitor modes respectively. For this display, the function switch only selects which modulation reading is displayed. e. RF Memory — The nine stored RF frequencies or DPL codes with their corresponding PL and the current frequency in use are displayed. f. Tone Memory — The user selectable parameters for the code synthesizer are displayed. g. Freq Counter — The frequency of the signal input to the front panel frequency counter jack is displayed. h. DVM/Dist — The true RMS AC or DC level of the signal at the front panel DVM jack is displayed. The AC or DC mode is selected with the display cursor and the keyboard. The battery voltage is also displayed. i. Ext Wattmeter — The external wattmeter element selected and the forward and reflected power being passed thru that element are displayed. The element select is changed by entering the appropriate range number with the keyboard. j. IF — The 455 kHz IF signal from the monitor receiver is displayed. k. Scope AC — The voltage waveform applied to the front panel vertical input is displayed. The vertical input is AC coupled. l. Scope DC — The voltage waveform applied to the front panel vertical input is displayed. The vertical input is DC coupled. a. Gen - equipment generates and outputs an RF signal.

301

Table 4-1. Controls, Indicators, and Connectors (Cont)

Item	Description	Function
FRONT PANEL (fig. 4-1)		
FUNCTION indicators	Six LEDs (red)	<p>b. Pwr Mon - equipment monitors input signals with the input terminated into the internal power meter. This position must be used for inputs of 0.2 watts and greater.</p> <p>c. Monitor - equipment monitors input signals with the input terminated into the receive mixer. This position is used for "off the air" monitoring.</p> <p>Indicates the mode or type of signal the equipment is set up to monitor or generate:</p> <ul style="list-style-type: none"> a. FM - equipment generates or monitors frequency modulated signals. b. CW - equipment generates an unmodulated RF signal. Monitor CW provides frequency error measurement only. c. AM - equipment generates or monitors amplitude modulated signals. d. SSB/DSBSC - equipment generates a double sideband suppressed carrier signal. NOTE: The level of the DSBC signal generated is not calibrated; it is for use in relative measurements only. Monitor SSB mode receives SSB signals with the use of the BFO. e. SWP 1-10 MHz - equipment generates a swept RF signal having a sweep width of 1 to 10 MHz, controlled by the Disp/Sweep control. Selection of Monitor Sweep has no effect; equipment remains in generate mode. f. SWP 0.01-1 MHz - equipment performs as in e. above except the sweep width limits are 0.01 MHz to 1 MHz.
MODULATION SWITCH	Three position toggle switch	<p>Controls the Code Synthesizer modulation source. Code Synthesizer mode is shown by the LEDs.</p> <ul style="list-style-type: none"> a. Cont - Continuous modulation signal output. b. Off - Turns off signal. When the mode is DPL or DPL Inv, returning the switch to Off from Cont produces a 133 Hz tone burst for a 120 ms duration.

4-6

Table 4-1. Controls, Indicators, and Connectors (Cont)

Item	Description	Function
FRONT PANEL (fig. 4-1)		
CODE SYNTH Mode indicators	Six LEDs (red)	<p>c. Burst - for PL, tone A, and tone B modes, the output is present for as long as the switch is held in the burst position. For the Tone Sequence mode the burst position causes a single signaling sequence to be output. For the DPL and DPL Inv modes the Burst position causes a 133 Hz tone to be output. For the Tone Remote mode either the Burst or the Control mode causes the output. The access sequence leaves tone A at a low level for transmit-type commands until the switch is returned to the Off position. This switch is spring loaded to return to the Off position from the Burst position.</p> <p>When illuminated, indicates the selected mode of the Code Synthesizer.</p> <ul style="list-style-type: none"> a. PL/DPL Indicator PL - Selected Private Line frequency output to 1 kHz. DPL - Selected Digital Private Line code output Maximum code number is 777. b. PL/DPL Inv Indicator PL - Same as above DPL - Inverted output of selected Digital Private Line code. Maximum code number is 777. <p>The Private Line frequency or the Digital Private Line code is selected from the RF memory display or entered from keyboard on the Gen Mon Mtr display.</p> <ul style="list-style-type: none"> c. Tone A Indicator Indicates Tone A selected for output d. Tone B Indicator Indicates Tone B selected for output e. Tone Sequence indicator Indicates a tone signaling sequence will be output. The sequence is selectable on the Tone Memory Display. See Tone Memory Table examples, Figures 4-9, 4-10, 4-11 and 4-12. f. Tone Remote indicator Indicates access sequence for Motorola Repeater will be output.

4-7

Table 4-1. Controls, Indicators, and Connectors (Cont)

Item	Description	Function
FRONT PANEL (fig. 4-1)		
DISPLAY select switches	Two-pushbutton switches	Tone A and B frequencies are entered from the keyboard on the Tone Memory Display.
		Selects the function to be displayed by the equipment, as indicated by the DISPLAY LEDs:
		<ul style="list-style-type: none"> a. Δ - moves the selection up one step at a time b. ∇ - moves the selection down one step at a time
FUNCTION select switches	Two-pushbutton switches	Selects the type or mode of the signal the equipment will generate or monitor as indicated by the FUNCTION LEDs. Operation is the same as for the DISPLAY select switches.
Code Synth Mode select switches	Two-pushbutton switches	Selects the Code Synthesizer output mode as indicated by the CODE SYNTH MODE LEDs. Operation is the same as for the DISPLAY select switches.
Code Synth Lvl control	Potentiometer	Controls the level of Code Synthesizer for modulation or MOD Output.
Ext Level control	Potentiometer/switch	Controls modulation level of external input (microphone and other external generators). Switch at full counterclockwise position disables external modulation inputs.
Mic connector	4-pin connector	Microphone input. Provides microphone bias and PUSH TO TALK (GENERATE) connection to equipment.
Ext Mod in connector	BNC connector	External modulation signal input.
1 kHz Level control	Potentiometer/switch	Internal 1 kHz tone modulation level control. Switch at full counterclockwise position disables 1 kHz modulation tone.
Mod Out connector	BNC connector	Output connector for all modulation signals (all signals combined).
Volume control	Potentiometer	Controls speaker output level.
BW switch	Two-position switch	In either Pwr Mon or Monitor modes selects IF bandwidth. NB is ± 6 kHz mod acceptance bandwidth. WB is ± 100 kHz mod acceptance bandwidth. In Gen FM mode selects modulation range: 0-25 kHz dev in NB mode or 0-100 kHz dev in WB mode.

4-8

Table 4-1. Controls, Indicators, and Connectors (Cont)

Item	Description	Function
FRONT PANEL (fig. 4-1)		
BFO control	Potentiometer/switch	BFO on/off and beat frequency control for sideband reception. Full Counterclockwise position is off. NOTE: To minimize interference the BFO should be turned off when not in use.
Sig Lvl/Zero Beat indicator	LED (red)	Flashes at a rate equal to the difference between the received carrier frequency and the programmed frequency. Also is used as a squelch indicator.
Squelch control	Potentiometer	Adjusts squelch threshold level, full counterclockwise position disables squelch.
Image/Dpix switch	Two-position switch	In duplex generation mode, controls the duplex frequency output for above (High) or below (Low) the receive programmed frequency. In the monitor mode it selects the frequency of the local oscillator (either above or below the programmed monitor frequency) to remove image interference.
Demod Out connector	BNC connector	Receiver audio output.
Oscilloscope Horiz switch	Seven-position rotary switch	When in the oscilloscope mode, selects the horizontal sweep rate or selects the external horizontal input.
Horiz Vernier control	Potentiometer	Horizontal sweep rate Vernier or external horizontal input gain Vernier. Calibrated position is fully clockwise beyond the quieting point.
Ext Horiz	BNC connector	Allows external horizontal inputs for oscilloscope.
Trig Level	Stacked concentric potentiometer and switch See "CAUTION" note on page 4-19	Selects oscilloscope trigger level and trigger mode. Center knob selects the level of trigger. Outside (largest) knob controls the trigger mode. In Auto position, continuous sweep with external sync signal, syncs on vertical input. Normal position, no signal, syncs on vertical input. Sync on vertical input.
Position controls	Stacked concentric controlled potentiometer • Vert • Horiz	Controls the position of the CRT display, when in the oscilloscope mode.
	Center (small) control knob	Controls the vertical position of the CRT display
	Outside (large) control knob	Controls the horizontal position of the CRT display

4-9

Table 4-1. Controls, Indicators, and Connectors (Cont)

Item	Description	Function
FRONT PANEL (fig. 4-1)		
Vert switch	Four-position rotary switch	Oscilloscope operation uses values marked to the right of the switch, indicating volts per division on the CRT. Values marked to the left of the switch are used during modulation display mode, indicating range for calibrated FM deviation.
Vert Vernier control	Potentiometer	Vernier gain control for vertical inputs to the CRT when in the oscilloscope mode. Fully clockwise is the calibrated position.
Vert/Sinad/DVM/Dist/Counter In Connector	BNC connector	Signal input to the equipment for the following operations:
		a. External vertical for oscilloscope operation
		b. Distortion/SINAD Meter
		c. Frequency Counter
		d. Digital Voltmeter
RF in/out connector	Type N connector	RF input in the power monitor or monitor mode. RF output in the generate mode.
RF Level Variable control	Potentiometer	Vernier control of RF output level. Exceeding the AM limit marking in AM generation mode may result in a distorted output.
RF Level Step Switch	14-position ganged attenuator and switch	Ten dB per step control of RF output level in generate mode. Also serves as RF input level step attenuator in monitor and spectrum analyzer modes.
Ext Wattmeter	Connector	Allows input from Motorola ST-1200 series inline wattmeter elements for measurement and CRT display of forward and reflected transmitted power.
Freq Set controls	Stacked concentric potentiometers	Controls the duplex generator output frequency in the Duplex Generation mode.
• Coarse	Inside (small) control knob	Coarse frequency control.
• Fine	Outside (large) control knob	Fine frequency control.

4-10

4-5. OPERATION

4-6. The operator may use the CRT display to become familiar with the functions the Communication System Analyzer is capable of performing. The unit may be preset to any of the functions the unit performs. As a function and its parameters are selected they are displayed on the CRT.

The unit contains a nonvolatile memory that stores frequently used data for fast access, reducing setup time. As a function is selected, if data for that function is stored, the data is displayed on the CRT.

One of the stored parameters may be used or the user may manually select (keyboard entry) the parameters required for the function. Selection of stored data or keyboard entry of data is cursor controlled. As a control is changed the CRT display changes to reflect the new parameter being used for function being performed.

4-7. **CALIBRATE.** The Communication System Analyzer may be calibrated to WVV or other time/frequency standards (Figure 4-4). To calibrate the unit's time base (frequency standard) proceed as follows:

- Connect antenna to HF In/Out connector.
- Set FUNCTION switch to Monitor and DISPLAY to Gen/Mon Mtr.
- Enter frequency of time/frequency standards station directly from keyboard.
- Select AM function.
- Using a tuning tool, adjust time base frequency calibration control (on left side of housing) until CRT frequency error display indicates less than 5 Hz error. Frequency stability to 0.5 part per million can thus be achieved using a 10 MHz frequency standard station.

NOTE

The time base output is also available on the rear panel for external measurement or laboratory calibration to better than the 0.5 ppm achievable with the above method.

NOTE

An external time base input is also provided on the rear panel.

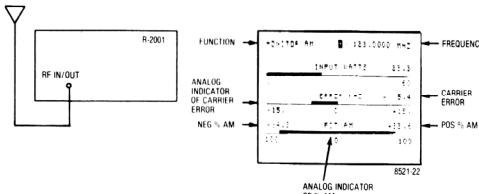

Figure 4-4. System Analyzer Time Base Calibrate Test Setup and CRT Display

4-12

Table 4-1. Controls, Indicators, and Connectors

Item	Description	Function
FRONT PANEL (fig. 4-1)		
Frequency offset control (0-10 MHz/Off/45 MHz)	Three-position switch	Selects the offset of the transmitted frequency from the transmitted frequency. Image-Disk switch determines side of selected frequency the offset will be. 0-10 MHz position allows frequency offset to be varied between 0-10 MHz. In the 45 MHz position the offset is variable over a small range around 45 MHz with the use of the Fine frequency control.
Output connector	BNC connector	Output connector for duplex generator output.
SIDE PANEL (fig. 4-2)		
Frequency Standard control	Potentiometer	Allows calibration of the time base frequency (freq std).
REAR PANEL (fig. 4-3)		
DC 8A	Line fuseholder (8 amp)	DC input line fuseholder.
DC IN power connector	4-pin connector	Connects to DC prime power source.
AC power connector	3-pin connector	Connects to AC prime power source. Internally patched to accommodate either 100-110 VAC, 110-130 VAC, 200-220 VAC or 220-260 VAC.
AC 1.5A	Line fuseholder	AC line fuseholder. Use a 1.5A fuse when input voltage is between 100-130 VAC and a 0.75A fuse when input voltage is between 200-260 VAC.
10 MHz std IN connector	BNC connector	Provides for external 10 MHz time base input. Equipment automatically switches to external time base with an input at this connector.
10 MHz std OUT connector	BNC connector	Provides an output of the internal or external 10 MHz time base for external use.
488 BUS connector		Placement of I/O connector when IEEE-488 Interface Bus option is provided.
Blower power connector	4-pin connector	Provides 110 VAC to the cooling fan.

4-11

4-8. **GENERATOR OPERATION.** The system generates RF frequencies for FM, AM, CW, SSB, and DSBSB types of transmission covering a range of 10 kHz to 1000 MHz. To generate a signal the FUNCTION switch is placed in the Gen position.

NOTE

An RF protection circuit to protect against damage due to inadvertent application of RF power to the unit, when in a generate or sensitive monitor mode, is functional over the full monitor frequency range of the equipment (2 to 1000 MHz).

The type of signal is selected using the FUNCTION select LED indicator column. The unit can deliver an output of up to 1 volt into 50 Ohms. When in the AM generate mode the variable control (located in the RF SECTION on the front panel) should not be set above the AM limit mark. Exceeding this may cause distortion in the output.

NOTE

The RF protect circuit may trip if generator is run at full power output without having a 50-ohm load connected.

4-9. **DUPLEX GENERATION.** When operating in the duplex generate mode the offset frequency can be set to either 45 MHz or 10 MHz as applicable. The Image-Disk switch sets the offset frequency above (high) or below (low) the nominal frequency. When offset is in the 0 to 10 MHz range, the control range may include a feedback region. If the generator is operated in this feedback area erroneous frequency output indications can be given. Avoid areas where backward indication or a jittering display of the offset frequency are incurred. The following is an example of the duplex generator being used to setup repeater levels (Figure 4-5).

- Connect DUPLEX GEN output to repeater receiver antenna input and repeater transmitter signal sample to HF In/Out connector. The Duplex Gen Output level is fixed at -30 dB nominal.
- Set FUNCTION switch to Gen and DISPLAY to Duplex Gen.
- Select Duplex Monitor frequency (repeater transmit frequency) from memory table or enter directly from key board.
- Set DUPLEX GENERATOR frequency to repeater receiver frequency.
- Adjust PL and test tone deviation to desired level on display.
- Set FUNCTION switch to Monitor and measure the deviation of the repeated signal.

NOTE

Switch function to power monitor and connect repeater transmitter (under 125 watts) directly to the RF In/Out connector to read power and frequency error as well.

4-13

7. Adjust the Code Synth Lvl control for the desired level of modulation.
8. Set the Code Synth Mode to Signal Sequence and the MODULATION switch as desired to activate the pager under test.
9. The scope trigger delay setting at the bottom of the Tone Memory Display can be entered as necessary to delay the triggering of the oscilloscope horizontal sweep from the start of the tone sequence. This feature aids in troubleshooting tone decoders with the system oscilloscope.

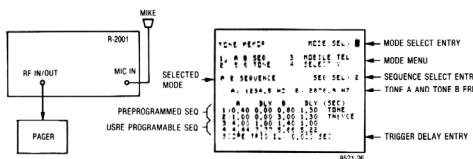

Figure 4-9. Test Setup for Two-Tone Pager and Alert Functions with CRT Display

- Test 5/6 Tone Pager decode and alert function (Figure 4-10).
- Set FUNCTION switch to Gen and DISPLAY to Gen/Mon Mtr.
- Select pager frequency from RF memory table or enter directly from the keyboard.
- Set the DISPLAY to Tone Memory and enter the 5/6 tone mode number in the mode select position from the keyboard. For a 5/6 tone sequence the mode number is 2. The stored information for the 5/6 tone sequence is then automatically displayed on the lower part of the display.
- Select either a 5-tone or a 6-tone sequence by entering a 1 or 2 in the sequence select position from the keyboard.
- Enter the desired CAP code from the keyboard.
- Set the DISPLAY to Gen/Mon Mtr., the Code Synth Mode to Tone Seq, and the MODULATION switch to Cont.
- Adjust the Code Synth Lvl control for the desired level of modulation.
- Connect the pager as shown in Figure 4-10 and set the MODULATION switch as desired to activate the pager under test.
- Enter the scope trigger delay setting at the bottom of the Tone Memory Display as necessary to delay the triggering of the horizontal sweep relative to the start of the tone sequence when troubleshooting the tone decoder with the oscilloscope.

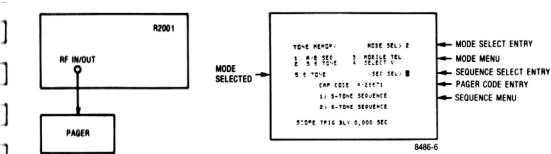

Figure 4-10. Test Setup for 5/6 Tone Pager with CRT Display

- Test Mobile Telephone Receiver and Supervisory Decoder (Figure 4-11).
- Set the FUNCTION switch to Gen and the DISPLAY to Tone Memory.
- Select the Mobile Telephone mode by entering the number 3 in the mode select position from the keyboard. The stored information for the mobile telephone sequences will be automatically displayed on the lower part of the screen.
- Select the desired mobile telephone sequence by entering the appropriate number in the sequence select position from the keyboard: 1-MTS, 2-MTS, 3-2BTS.
- With the keyboard enter the appropriate Tone 1 and Tone 2 frequencies on the display.
- Enter the desired telephone number from the keyboard into the Telephone Number position on the display.
- Set the DISPLAY to Duplex Gen and set the DUPLEX GEN switch to the 0-10 MHz or 45 MHz position as applicable. Enter the desired receive frequency from the keyboard and then set the desired transmit frequency using the DUPLEX GEN frequency controls.
- Set the MODULATION switch to the Cont position and adjust the Code Synth Lvl control for the desired level of modulation.
- Set the FUNCTION to Pwr Mon and the DISPLAY to Gen/Mon Mtr.
- Connect the system to be tested as shown in figure 4-11 and set the MODULATION switch as required to test the mobile telephone receiver and supervisory decoder.
- Enter the scope trigger delay setting shown at the bottom of the Tone Memory display as necessary to aid in troubleshooting the decoder circuits.

CAUTION: The entry of a scope trigger delay will prevent normal operation of scope triggering as long as the unit is in the position "MODULATION". "Tone Seq."

4-18

4-19

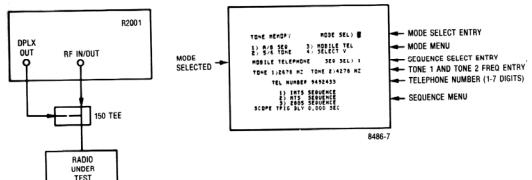

Figure 4-11. Test Setup for Mobile Telephone Test with CRT Display

e. Test Select V decode function (Figure 4-12).

- Set the FUNCTION switch to Gen and the DISPLAY switch to Tone Memory.
- Select the Select V mode by entering the number 4 in the mode select position from the keyboard. The stored information for the mobile telephone sequence will be automatically displayed on the lower part of the display.
- Enter the number of the desired Select V sequence in the sequence select position on the display from the keyboard.
- Enter the desired access number from the keyboard into the access code position on the display.
- Set the DISPLAY to Gen/Mon Mtr., the Code Synth Mode to Tone Seq, and the MODULATION switch to Cont.
- Adjust the Code Synth Lvl control for the desired level of modulation.
- Connect the system to be tested as shown in figure 4-12 and set the MODULATION switch as desired to test the Select V decoder.
- Enter the scope trigger delay setting shown at the bottom of the Tone Memory display as necessary to aid in troubleshooting the decoder circuits.

SECTION V

MAINTENANCE

5-1. SERVICE

5-2. The Motorola Test Equipment Repair Center is charged with the service responsibility for all test equipment supplied by the Motorola Communications Group. The center maintains a stock of original equipment replacement parts and a complete library of service information for all Motorola test equipment.

5-3. Most in-warranty repairs are performed at the center. Exceptions include repairs on some equipment not manufactured by Motorola which are performed by the original supplier under the direction of the Test Equipment Repair Center. Out-of-warranty service is performed on a time and materials basis at competitive rates and the maximum turn-around goal is less than ten working days. Customer satisfaction is continually surveyed by reply cards returned with repaired instruments.

5-4. The Test Equipment Repair Center also provides a convenient telephone troubleshooting service. Frequently, a user technician can troubleshoot a piece of equipment and isolate defective components under the direction of the Test Equipment Repair Center via telephone. Required replacement parts are then immediately shipped to the user thereby reducing shipping time and servicing costs. For telephone troubleshooting contact the Test Equipment Repair Center toll free at (800) 323-6967.

5-5. All other inquiries and requests for test equipment calibration and repairs should be directed to the Area Parts Office. They will contact the Test Equipment Repair Center, process the necessary paperwork and, if necessary, have the Center contact you to expedite the repair.

5-6. REPLACEMENT PARTS ORDERING

5-7. Motorola maintains a number of parts offices strategically located throughout the United States. These facilities are staffed to process parts orders, identify part numbers, and otherwise assist in the maintenance and repair of Motorola Communications products.

5-8. Orders for all replacement parts should be sent to the nearest area parts and service center listed below. When ordering replacement parts the complete identification number located on the equipment should be included.

CAUTION

This equipment contains parts that are subject to damage by static electricity. Proper precautions should be taken during handling.

WARNING

Lithium Battery

The processor module within this system utilizes a lithium battery as a memory keep-alive voltage source. Do not mutilate or disassemble the battery cell. The lithium metal is a very active material that burns in the presence of water or high humidity. Do not put the battery in fire, attempt to charge, heat above 100°C, or solder directly to the cell. Do not overdischarge the cell to a reverse voltage greater than 3 volts. The battery may burst and burn or release hazardous materials. See paragraph 5-143 of this manual for battery troubleshooting procedures and cautions.

CAUTION

Lithium Battery

Lithium batteries are classified as hazardous materials and must be disposed of accordingly. Do not dispose of the battery by placing it in with the everyday trash. Consult state and local codes for the appropriate disposal procedure. Motorola will dispose of the battery if the expended battery is returned in the replacement battery container and by the same method that the new battery came to you to: Motorola Inc., Return Goods Department, 1313 East Algonquin Road, Schaumburg, Ill. 60196.

5-14. MAJOR ASSEMBLIES

5-15. The Communication System Analyzer is designed for ease of maintenance. Most of the circuitry is on twelve plug-in circuit boards. A list of all subassemblies is given in table 5-1. The assembly locations are shown in figures 5-1 and 5-2.

Table 5-1. List of Subassemblies

5-16. THEORY OF OPERATION

5-17. General

5-18. The operation of the Communications System Analyzer can be divided into nine basic functions: Generate, Power Meter, Monitor, Duplex Generator, Code Synthesizer, Frequency Counter, Digital Voltmeter (DVM), Oscilloscope, and Distortion/SINAD Meter. The general operation of the unit will simultaneously incorporate the basic functions to provide the total capability of the system.

5-19. The following discussion will cover the block diagrams for each of the basic functions plus a discussion on the processor control of the system. A functional block diagram of the total system is shown in figure 5-3. Only the major signal paths between each of the modules are shown to clarify the total system configuration.

5-5

1 JUMPERS ARE INSTALLED WHEN THE IEEE OPTION IS NOT INSTALLED.
2 WITH IEEE OPTION, THE RF ATTENUATOR IS CONTROLLED BY THE IEEE CARD. OTHERWISE FRONT PANEL CONTROLLED.

821-1

Figure 5-3. Communication System Analyzer, Block Diagram

5-7

5-20. System Control

5-21. System Control is the primary responsibility of the internal microprocessor. Front panel control and system status inputs to the processor are manipulated by the processor to provide the control for the operating mode. From the front panel the processor monitors the keyboards, the function select switch, the modulation control switch, the RF scan switch, the image switch, the bandwidth switch, the horizontal and vertical range switches, and the step attenuator switch. This information plus internal status information causes the processor to display the appropriate information on the CRT to program the center frequency, to set up the generate or monitor mode, and to make the internal switching arrangements for the selected operating state.

5-22. The interface to and from the microprocessor is via the processor bus. This bus consists of a 16-bit address bus, an 8-bit data bus, and a 7-bit control bus. This bus interfaces the processor to its program memory (ROM), scratch pad memory (RAM), IEEE interface, and the peripheral interface adapters (PIA). The PIA is the mechanism by which the processor interfaces with the system. A PIA consists of a dual 8-bit latch which may be programmed as either an input or output for the microprocessor. System input and control information passes to and from the microprocessor via three system control buses attached to a PIA.

5-23. Each system control bus consists of a 4 bit address bus, a 4 bit data bus, and an enable line. The 4 address bits determine which of 16 possible latches the 4 bits of data is to be sent to or received from. The enable line triggers the actual transfer of data. The three control buses within the system are called the RF control bus and the AF control buses 1 and 2. The RF control bus is as described above while the AF control buses consist of a single 4-bit address and 4-bit data bus and two enable lines. The resulting total input/output capability for the system buses is 16 latches at 4-bits each times 3 buses or 192 bits. A tabulation of buses and the controlling or input function of each bit is shown in table 5-2.

5-24. Systems with the IEEE remote control option interface the IEEE bus to the processor bus through a general purpose interface bus adapter (GPIB) on the IEEE interface module. When enabled all control inputs to the system pass through the IEEE bus and front panel controls are ignored. For more information on IEEE control see section 21.

5-25. Generate Mode

5-26. The generate mode provides a variable level RF output that is phase locked to the internal 10 MHz standard. AM, FM, and Sideband Modulation are possible on the output signal. A block diagram of the generate mode is shown in figure 5-4.

5-27. The Frequency Standard module (A13) contains a 10 MHz standard oscillator with buffering and switching to provide a 10 MHz signal to the EXTERNAL 10 MHz OUTPUT and to the RF Synthesizer (A5). A provision is made for the application of an EXTERNAL 10 MHz INPUT which causes the internal standard to shut down and the EXTERNAL 10 MHz INPUT to be switched to the EXTERNAL 10 MHz OUT and to the RF Synthesizer.

5-28. The 10 MHz standard input to the RF synthesizer is digitally divided down to provide SYSTEM REFF FREQUENCIES for the frequency counter, the zero beat detector, the second local oscillator in the receiver, and the processor timing reference. Additionally reference frequencies are provided for a fixed 550 MHz locked loop and for a programmable 500 MHz-1000 MHz locked loop. The programming of the 500 MHz-1000 MHz locked loop is provided by the RF CONTROL BUS from the processor. The SELECT SWITCH selects one of three possible output points for the SYNTH RF output signal. The first is from the 500 MHz-1000 MHz loop directly. The second is from a divide by two on the output of the 500 MHz-1000 MHz loop which gives frequencies from 250 MHz to 500 MHz. For outputs below 250 MHz, the output of the 500 MHz-1000 MHz loop is mixed with the fixed 550 MHz signal and the difference signal used for the output. For this output the processor programs the 500 MHz - 1000 MHz loop for frequencies between 550.01 MHz and 800 MHz to obtain outputs from 10 kHz to 250 MHz respectively.

5-29. FM and SWEEP Modulation is implemented within the 500 MHz-1000 MHz loop. FM capability is 200 kHz peak which when divided by two gives the 100 kHz peak requirement. Similarly the sweep capability is 10 MHz peak which provides the 5 MHz requirement for the sweep generator and spectrum analyzer requirements.

5-10

action protects the Wideband Amp and Step Attenuator against burnout. A signal line from the protection network signals the processor that the system is in the protected mode. The processor in turn activates the CRT and alarm networks.

5-34. Power Meter

5-35. Input power measurements are made with the RF input terminated into an internal 50 ohm load. This termination is the same one used for the protect mode when in the generate or monitor functions. A block diagram of the power meter is shown in figure 5-5.

5-36. For power meter mode the processor sets the WATT METER ENABLE line to cause the RF input jack to be connected to the 50 ohm power termination. For modes other than the power meter, an input detector on the RF input jack detects when the input power has exceeded 200 mW and then switches the input to the load.

5-37. The switch is a single pole double throw configuration so that when switched to the RF load path to the Step Attenuator and Converter is open circuited. However, leakage across the open switch provides sufficient signal for operation of the normal monitor functions.

5-38. A sample of the RF voltage being applied to the RF Load is detected by the Power Detector to give a DC output proportional to the peak RF voltage. The amplifier following the detector buffers and gain adjusts the detected voltage to provide the RF INPUT POWER signal to the processor. The processor then determines and displays the RF input power.

5-39. A Temperature Sensor located near the flange of the RF Load alerts the processor when the load temperature exceeds 100°C. The processor reacts to the OVER TEMPERATURE signal by displaying a warning message on the CRT and by sounding the audible alarm.

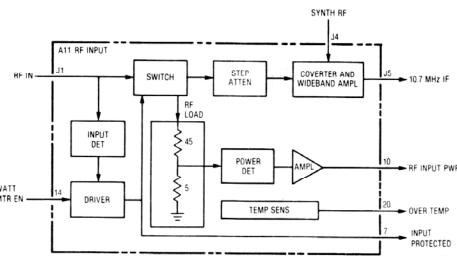

Figure 5-5. Power Meter Block Diagram

5-12

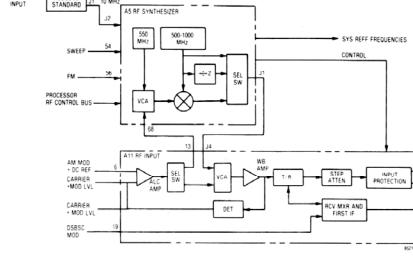

Figure 5-4. Generate Mode Block Diagram

5-30. The SYNTH RF signal is amplified and leveled in the RF input module (A11). The signal level at the output of the wideband amp is detected and compared to the AM MOD & DC REF signal from the front panel level control. If there is a difference between the two signal levels, the ALC amp provides an error voltage. The error voltage controls the VCA and the local oscillator. The local oscillator is controlled by the processor via the RF CONTROL BUS. The output of the wideband amp is compared to the AM MOD & DC REF signal. There are two possible VCA's for the output leveling. The VCA within A11 is used for frequencies from 1 MHz to 1000 MHz. For frequencies below 1 MHz, the VCA on the RF Synthesizer module is used to minimum attenuation and the VCA on the RF Synthesizer module is used for leveling. Amplitude modulation is incorporated by summing the modulation signal with the DC reference signal to force the leveling loop to vary the output level in proportion to the modulating signal. The signal from the RF level detector (CARRIER + MOD LVL) is used by the processor for the determination of RF output level and the percent AM. The leveled output range of the Wideband Amp is from -3 dBm to +13 dBm (0.16 to 1.0 Vrms).

5-31. The leveled output from the Wideband Amplifier is applied to the Generate/Monitor (T/R) switch. For AM, FM, and CW signals the switch connects the amplifier output to the Step Attenuator. For Double Sideband Suppressed Carrier (DSBSC) the T/R switch is in the "R" position where the amplifier output is connected to the local oscillator port on the receive mixer and the attenuator is connected to the RF port. The DSBSC MOD signal is then used to drive the IF port of the mixer giving a DSBSC signal at the RF port and thus at the Step Attenuator.

5-32. Coarse level control in 10 dB increments is provided by the Step Attenuator. The total range of the attenuator is from 0 dB to 130 dB attenuation. For the basic R2001C the Step Attenuator is controlled directly by a shaft to the front panel knob. With the IEEE control option the Step Attenuator is electrically programmable and controlled by the processor. The front panel in this case is connected only to a rotary switch which directs the processor in setting the attenuation level. Under IEEE control, commands via the IEEE bus determine the attenuator setting. (See section 21.)

5-33. The RF signal from the Step Attenuator passes through the input protection circuitry to the RF Output jack. A level detector on the RF Output jack monitors the power level at the jack. If power in excess of 200 mW is applied to the Output jack, the protection circuit will activate and switch the RF Output jack to the internal 50 ohm load. This switch is controlled by the input protection circuit.

5-11

5-40. Monitor Mode

5-41. The monitor mode allows RF signals from an antenna or from a transmitter directly to be checked for frequency error, modulation level, and spectral content. AM, FM, and sideband modulations can be accommodated with this system. A block diagram of the monitor mode is shown in figure 5-6.

5-42. The RF signal to be monitored is applied to the RF input jack on the RF Input module (A11). If the input level is less than minimum, the signal is passed directly through the input protection circuitry to the Step Attenuator. For input levels greater than 200 mW the protection circuit switches the input to the internal load and signal the operator to switch to the Power Monitor mode. In this case, RF leakage (paragraph 5-37) through the protection circuits provides the input signal to the Step Attenuator.

5-43. For the monitor mode the T/R switch is set so that the RF input from the Step Attenuator is connected to the RF port on the receive mixer. The output from the wideband amp is switched to the local oscillator port on the receive mixer. The processor programs the RF Synthesizer for an output frequency that is offset from the frequency to be monitored by 10.7 MHz. The offset may be above or below the center frequency as selected by the front panel image switch.

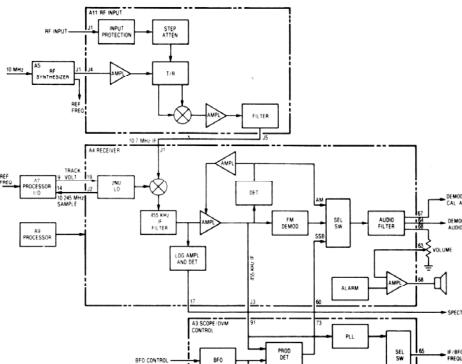

Figure 5-6. Monitor Mode Block Diagram

5-13

5-71. Digital Voltmeter (DVM)

5-72. The processor through the DVM circuitry has access to voltage information at a large number of points throughout the system. From this information the processor is able to determine and display parameters such as: output power level, modulation level, input power level and the like. In addition, an external voltage applied to the DVM input jack on the front panel can be measured and displayed for external voltage measurements. A block diagram of the DVM function is shown in figure 5-10.

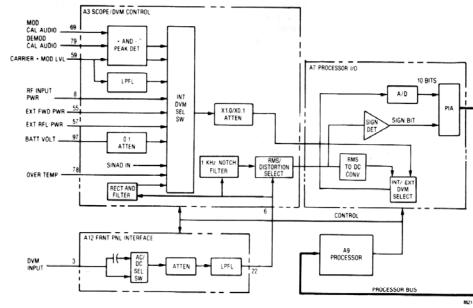

Figure 5-10. Block Diagram DVM/Distortion Analyzer

5-73. Internal voltage measurements are selected and ranged over two decades by the INT DVM SELECT SWITCH and the X1/X10 attenuator respectively on the Scope/DVM Control (A3) module. The resulting 0 to 1 VDC signal is routed to the INT/EXT DVM SELECT SWITCH on the Processor Interface (A7) module which applies the voltage to the A/D converter. The A/D converter converts the input voltage into a 10 bit digital word which is input to the processor. One of eight internal voltages may be selected for measurement by the processor to determine desired range. The range is 0.01 to 1 VDC inclusive, with the decade X1/X10 ranging attenuator the maximum input voltage to the internal DVM is 10 VDC. The X1/X10 attenuator is switched in for better voltage reading resolution on voltages less than 1 VDC. To keep CRT information current, each of the required measurements are made in sequence at an approximate rate of thirty per second.

5-74. Two modulation signals (MOD CAL AUDIO and CARRIER + MOD LVL) and a demodulated signal (DEMOD CAL/AUDIO) are made available to the peak detectors. Positive and negative peak determination of the selected signal enables the processor to determine the level of modulation.

5-75. A Lowpass Filter (LPFL) removes the DC component from the CARRIER + MOD LVL signal so that the generate RF output level can be determined. Refer to paragraph 5-30.

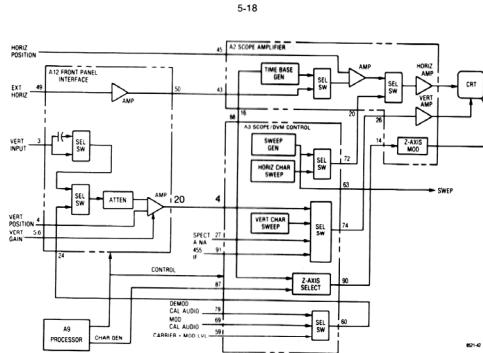

Figure 5-11. Oscilloscope Block Diagram

5-88. Six decade sweep ranges from 1 μ sec to 100 msec per division are provided by the Time base Generator. Control of the Time base Generator is from the front panel horizontal switch through the processor.

5-89. Front panel external horizontal inputs are applied to the top of the horizontal vernier gain potentiometer. The wiper of the gain potentiometer is the EXTERNAL HORIZONTAL INPUT signal to the preamp on the Front Panel Interface module (A12). The preamp provides the required horizontal input sensitivity and buffers the signal to the select switch on the Scope Amplifier module.

5-90. Internal horizontal signals, Sweep Generator and Character Sweep outputs, are selected on the Scope/DVM Control module (A3). The Sweep Generator provides a sawtooth waveform to the RF Synthesizer module for the sweep generator and spectrum analyzer functions. The sweep signal to the CRT horizontal input causes the scope sweep to be synchronous with the synthesizer sweep for the spectrum and sweep filter response displays.

5-91. The Horizontal Character Sweep generator output is a sawtooth waveform that provides the horizontal sweep for the raster scan character display.

5-92. One of four possible vertical signal sources are switched to the Vertical Amplifier input by a Select Switch on the Scope/DVM Control module. The 455 kHz IF and SPECTRUM ANALYZER signals from the Receiver Module provide the IF envelope and spectrum analyzer displays respectively. The Vertical Character Sweep generator gives the vertical sweep for the raster scan character display. The remaining input is the path for external vertical or modulation scope vertical inputs from the Front Panel Interface module.

5-93. A vertical preamplifier on the Interface module gives a vertical sensitivity of 10 millivolt per division and provides positioning and vernier gain capability for its input. The amplifier is preceded by a four decade range attenuator

5-76. The RF INPUT POWER and OVERTEMP signal lines from the RF Input module provide the processor inputs for the internal wattmeter (Paragraph 5-38). External wattmeter element inputs (EXT FWD PWR and EXT RFL PWR) from the front panel jack provide the information for the external wattmeter display.

5-77. A signal line from the DC input jack on the rear panel (BATT VOLT) is brought to the processor for battery voltage determination. The voltage is attenuated by a factor of 10 to stay with the 10 volt maximum input to the select switch. The processor uses the battery voltage measurement to warn the operator when the battery is near its discharged state.

5-78. A rectified and filtered version of the input to the 1 kHz NOTCH FILTER is the last internal measurement point. This measurement is used as part of the distortion/SINAD reading. For further information on the distortion/SINAD meter see paragraph 5-82.

5-79. EXTERNAL DVM — In the external DVM mode, voltages applied to the Ext DVM input jack on the front panel are ranged by processor control over four decades in the Front Panel Interface (A12) module. The result is a 0 to 1 Vrms signal at the output of the attenuator for inputs of 0 to 300 VRMS. The signal is routed directly through the A3 module by the RMS/Distortion Select Switch to the RMS to DC Converter on the A7 module. The INT/EXT DVM Select Switch applied the output of the RMS to DC Converter to the A/D converter for input to the processor.

5-80. For external DC measurements the AC/DC Select Switch selects the DC-coupled path from the Ext DVM input. A low pass filter (LPFL) in the A12 module removes ripple components. The rejection at 50 Hz is 25 dB in the low pass filter. The RMS to DC Converter reads the absolute value of the DC input, and the sign detector (SIGN DET) provides polarity information.

5-81. For AC voltage measurements the LPFL is reprogrammed for less than 0.5 dB attenuation out to 10 kHz. The AC/DC Select Switch selects the AC coupled path, and the RMS to DC Converter converts the AC input into a DC voltage equal to the RMS voltage of the input.

5-82. Distortion/SINAD Meter

5-83. The distortion of a signal with a 1 kHz fundamental frequency can be measured by the R2001C. The 1 kHz input enters the Ext DVM input jack through the AC-coupled path and is ranged to between 0 and 1 volt RMS by the ranging attenuator. The signal is routed through the notch filter where the fundamental frequency is removed. The output of the notch filter is selected to the RMS to DC Converter input by the RMS/Distortion Select Switch where the RMS voltage of the distortion components (to 10 kHz) is measured. The input of the notch is rectified, filtered, and multiplied by 1.11 (the RMS to AVERAGE ratio for a sinusoid). The resulting DC voltage is measured by the internal DVM as described in paragraph 5-73. The processor divides the RMS output voltage of the notch filter by the RMS input voltage to the notch filter to obtain a distortion ratio. The distortion ratio is converted by the processor for the SINAD display. The percent distortion display is obtained by multiplying the distortion ratio by 100.

5-84. Oscilloscope

5-85. Three basic functions are provided by the system oscilloscope. The alphanumeric and modulation displays provide operating mode and control information for the system. The external oscilloscope feature augments the total system as a general purpose test instrument. A block diagram of the oscilloscope function is shown in figure 5-11.

5-86. Drive signals for the CRT are provided by circuits on the Scope Amplifier module (A2). Horizontal and vertical signals are amplified by their respective amplifiers from 0.5 volt/division input levels to the levels required on the deflection plates. A Z-Axis Modulator circuit controls the cathode to grid bias voltage on the CRT to effect intensity control.

5-87. The horizontal position input is selected between external and internal scope functions. External functions, Time base Generator or external horizontal input, are switched to a summation amp where the HORIZONTAL POSITION signal from the front panel is added. The resulting DC offset positions the display horizontally on the CRT.

which is controlled from the front panel vertical switch through the processor. The attenuator provides external vertical input sensitivities from 0.01 to 1.0 volt per division and modulation scope sensitivities from 0.25 to 25 kHz per division.

5-94. A Select Switch ahead of the Attenuator selects between the external vertical input or the modulation scope inputs. The External Vertical input path is further selected between AC and DC coupling before becoming the vertical input to the CRT. The modulation scope signal path is switched to one of three possible sources on the Scope/DVM Control module. Demodulation signals from the Receiver are selected via the DEMOD CAL AUDIO path, and frequency and amplitude modulation signals via the MOD CAL AUDIO and CARRIER + MOD LVL signal paths respectively. The Audio Synthesizer module provides the MOD CAL AUDIO signal while the RF Input module gives the CARRIER + MOD LVL signal.

5-95. A Z-Axis Select circuit on the Scope/DVM Control module gates either the CHARACTER GEN signal for character displays or the retrace blanking signal from the Time Base Generator for scope displays to the Z-Axis Modulator on the Scope Amplifier module.

5-96. ALIGNMENT PROCEDURE

5-97. Introduction

5-98. This section provides a basic (para 5-102) and an extended (para 5-115) alignment procedure. The basic procedure requires only the use of a calibrated oscilloscope. It is expected that the basic alignment be performed whenever service work is performed. The extended alignment procedure requires module extenders and a calibrated digital voltmeter in addition to the oscilloscope. The extended procedure should be performed as required after servicing the system. All adjustments not covered in this procedure are to be performed on suitable module test fixtures only.

5-99. Test Equipment Required

5-100. The test equipment or its equivalent listed in table 5-3 is required for the basic procedure. The additional equipment required for the extended procedure is listed in table 5-4.

Table 5-3. Basic Test Equipment Required

Description	Model
*Oscilloscope Test Point Shunting Jumper Nonmettalic Alignment Tool	Motorola R1029A

*An R2001 is a suitable substitute

Table 5-4. Extended Test Equipment Required

Description	Model
*Oscilloscope	Motorola R1029A
Digital Voltmeter	Motorola R1024A
*RF Signal Generator	Motorola R1201A
*Modulation Meter	Boonton 82AD
Audio Generator	Motorola S1067
Receiver Test Cover	Motorola 15-80346A49
Extender Card Set	Motorola RPX-4150A

*An R2001 is suitable for use in place of these separate equipments.

-101. Preparation for Alignment

1. All alignments to be performed at normal ambient temperature.
2. Remove the top cover of the unit to be aligned.
3. Apply power to the unit to be aligned and allow a warmup time of 15 minutes prior to alignment.

-102. Basic Alignment Procedure

i-103. CRT Astigmatism and Geometry

1. Select the Monitor Function and the Gen/Mon Mtr Display on the R2001C. Set the Intensity Control for a medium intensity display.
2. While using the Focus Control to maintain a focused display at the center of the CRT, adjust the Astigmatism and Geometry potentiometers (Figure 5-12) for the best focus at the outer edges of the CRT while minimizing the pincushion and barrel distortion of the display. The two adjustments are interactive so that repeated small adjustments alternated between the two potentiometers will be required to obtain the best display.

i-104. CRT Intensity Bias

1. Select the Scope DC Display and the Ext Horiz. Input mode. Set the Intensity Control fully counter clockwise.
- CAUTION**
Do not let a dot stay in one place on the CRT screen for more than 30 seconds as a permanent burn in the phosphor will occur.

2. Adjust the Intensity Bias potentiometer (Figure 5-12) until a dot appears on the screen. (The Vertical and Horizontal Position Control on the front panel may have to be used to bring the dot on to the screen.) Then back off the Intensity Bias potentiometer until the dot just disappears.

i-105. CRT Intensity Balance

1. Select the Scope DC Display and the 1 mSec/Div Horizontal Sweep rate on the R2001C. Set the Horizontal Timebase Vernier to the Cal position and adjust the Intensity Control for a barely visible horizontal line on the CRT.
2. Adjust the Intensity Balance potentiometer (Figure 5-12) for uniform intensity of the horizontal trace from left to right. The Balance potentiometer affects the intensity on the left side of the trace.

i-106. CRT Horizontal Centering

1. Select the Gen/Mon Mtr Display on the R2001C. Adjust the Intensity Control for a comfortable viewing brightness.
2. With the Test Point Shorting Jumper connect TP1 of the Scope Amplifier Board (Figure 5-12) to chassis ground.
3. Adjust the Horizontal Position Potentiometer (Figure 5-12) so that the vertical trace on the CRT screen passes through the graticule center point.
4. Remove the jumper from TP1.

5-22

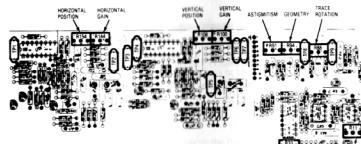

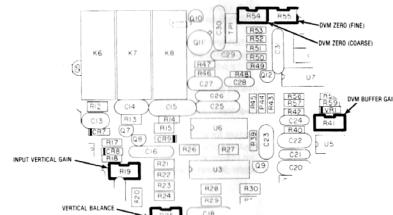

Figure 5-12. Scope Amplifier Alignment Points

5-111. Vertical Input Gain

1. Set the R2001C for the Generate FM Function and the Scope DC Display. Set the Horiz Control for 1m Sec/Div sweep rate and the Horizontal Vernier to the Cal position. Set the Vert Control for 1V/Div input sensitivity and the Vertical Vernier to the Cal position.
2. Connect an oscilloscope with a calibrated vertical input to the Mod Out Jack on the front panel.
3. Turn the Code Synthesizer off, the Ext Level off and adjust the 1 kHz Level Control for a 6V p-p sinewave on the attached oscilloscope.
4. Disconnect the oscilloscope from the Mod Out Jack and connect the Mod Out Jack to the Vert Input Jack on the R2001C.
5. Adjust the Input Vertical Gain Potentiometer on the Front Panel Interface Board (Figure 5-13) for a 6 cm p-p sinewave on the CRT. (Use the front panel Position Controls to center the waveform on the CRT.)

5-114. Horizontal Time Base

1. Select the Tone Memory Display and the Generate FM Function on the R2001C. Program tone A for 20.0 Hz and tone B for 2000.0 Hz.
2. Select the Modulation Display. Set the Oscilloscope Controls for 2.5 kHz/Div vertical range, Auto Trigger, and 10 mSec/Div horizontal sweep range. Set the Horizontal and Vertical Vernier Controls to their Cal positions.
3. Set the Code Synthesizer for Continuous, tone A, and turn up the Code Synth Level to obtain a nearly full scale sinusoidal waveform on the CRT. Turn the Ext Level and the 1 kHz Level Controls to the off position.
4. Adjust the Coarse Time Base Calibration Potentiometer on the Scope Amplifier Board (Figure 5-15) so that one cycle of the displayed waveform occurs in 5 cm along the horizontal axis. Use the Vertical and Horizontal Position controls to center and to move the waveform so that the 5 cm are measured in the middle of the screen to avoid nonlinearities near the edge of the CRT.
5. Set the Oscilloscope Horizontal Control for a 100 μSec/Div sweep rate and select the Tone B output on the Code Synthesizer.
6. Adjust the Fine Time Base Calibration Capacitor on the Scope Amplifier Board (Figure 5-15) so that one cycle of the displayed waveform occurs in 5 cm along the horizontal axis. Use the Vertical and Horizontal Position controls to center and to move the waveform so that the 5 cm are measured in the middle of the screen to avoid nonlinearities near the edge of the CRT.

Figure 5-15. Horizontal Time Base Alignment Points

5-115. EXTENDED ALIGNMENT PROCEDURE

5-116. DVM

1. Remove the R2001C top cover.
2. Connect the R2001C to a primary power source, turn it on, and select the EXT DVM mode. Allow approximately 15 minutes warmup before proceeding with the alignment procedure.
3. Short the center conductor of the DVM input jack on the front panel to ground. Connect an external DVM between TP2 and TP9 of the Scope DVM Control Board (Figure 5-14).
4. Adjust the Coarse DVM Zero and the Fine DVM Zero on the Front Panel Interface Board (Figure 5-13) until the external DVM reads 0 ± 0.5 millivolts DC.
5. Remove the short circuit on the DVM input jack and apply approximately 0.900 volts DC from an external power supply. The voltage between TP2 and TP9 of the Scope DVM Control Board should be within ± 1 mv of the voltage at the front panel DVM input jack. If the unit fails this test, adjust the DVM Buffer Gain on the Front Panel Interface Board (Figure 5-13) until the above two voltages are equal.

5-26

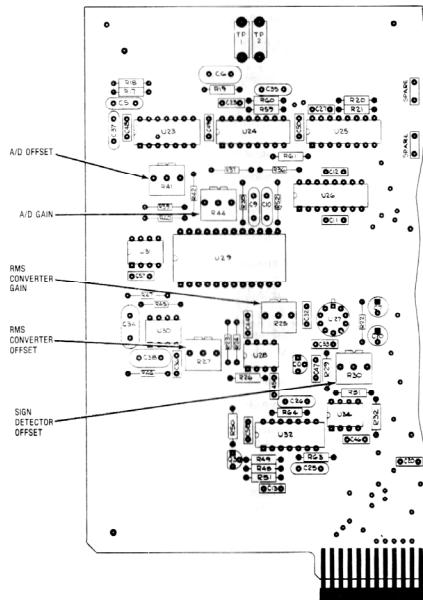

Figure 5-16. Processor I/O A/D Alignment Points

5-28

6. Select the generate FM narrowband mode and the Gen/Mon Metering display.

7. Short TP4 to TP9 on the Scope/DVM Control Board.
8. Adjust the A/D Offset on the Processor Interface Board (Figure 5-16) until the plus peak deviation reading on the CRT is just toggling between 0.00 and 0.01 kHz. Then slightly turn the adjustment just enough to make the reading 0.00 all the time. Note that if the offset adjustment is turned past this point the deviation reading is still 0.00 but the A/D converter is not aligned properly.
9. Remove the short circuit between TP4 and TP9, and connect the positive lead of the external DVM to TP4 of the Scope/DVM Control Board module. Place the negative lead on the ground plane or TP9 of the Scope/DVM Control Board.
10. Turn on the 1 kHz internal modulation and adjust the level until the voltage TP4 reads 0.900 volts.
11. Adjust the A/D Gain (Figure 5-16) until the reading on the positive deviation peak is 4.50 kHz.
12. Select the DC DVM mode.
13. With the center conductor of the front panel DVM input jack again shorted to ground, adjust the RMS Converter offset on the Processor Interface Board (Figure 5-16) for a reading of 0.000 volts on the CRT DVM display.
14. Adjust the sign detector offset (Figure 5-16) until the sign of the 0.000 volt reading is just flashing between plus and minus.
15. Remove the short and apply approximately 0.900 volts to the front panel DVM input jack.
16. While monitoring the input voltage on an external DVM, adjust the RMS Converter Gain on the Processor Interface Board (Figure 5-16) until the CRT DVM reading is equal to the external voltage applied.

5-117. Character Generator

1. Perform the Basic Alignment Procedure of para 5-102.
2. Select the Monitor FM Function and the Gen/Mon Mtr Display.
3. Adjust the Horizontal Character Sweep Width Potentiometer on the Scope/DVM Control Board (Figure 5-14) so that the right-hand edge of the CRT character display is approximately 4.2 graticule divisions to the right of the graticule center line.
4. Adjust the Vertical Character Sweep Width Potentiometer on the Scope/DVM Control Board (Figure 5-14) so that the bottom edge of the CRT display is approximately 3.3 graticule divisions below the graticule center line.

5-27

5-118. DISTORTION/SINAD ALIGNMENT

1. Enter the generate mode and the Gen/Mon Metering display. Using an audio generator with less than 0.1% distortion apply a 900 mVRMS 1 kHz ± 2 Hz signal to the Vert Sinad/DVM Dist/Counter In input on the front panel.
2. Verify that the distortion reading on the CRT is $<0.5\%$. If this test fails the notch filter should be aligned.
3. Turn the R2001C off and extend the Scope/DVM Control Board using the 100 pin extender card.
4. Turn the R2001C on and select the generate FM mode and the Gen/Mon Metering display.
5. Using the low loss distortion generator as in article 1, apply a 998 ± 0.2 Hz sine wave to the Distortion input.
6. Alternately adjust the 998 Hz notch potentiometers on the Scope/DVM Control Board (Figure 5-14) to null the distortion reading on the CRT. A reading less than 0.5% should be obtained.
7. Change the audio generator input frequency to 1002 ± 0.2 Hz.
8. Alternately adjust the 1002 Hz notch potentiometers on the Scope/DVM Control Board (Figure 5-14) to again null the CRT distortion reading. A reading less than 0.5% should be obtained.
9. Turn the system power off and reinstall the Scope/DVM Control Board into the R2001C.

5-119. Receiver

1. Perform the basic alignment procedure of para 5-102.
2. Turn the R2001C off and remove the Receiver Module. Remove the Receiver Module cover and install the Receiver Test Cover on the module housing. Extend the Receiver module on the Receiver Extender Card.
3. Turn the R2001C on and select the Monitor AM Function and the Gen/Mon Mtr Display. Set the monitor frequency to 250 MHz, the RF Step Attenuator to the 0 dB position, and the BW Switch to the Narrow position.
4. Connect the external signal generator to the RF In/Out Jack on the front panel. Adjust the external generator for an output level of approximately -60 dBm and a calibrated 30% AM.
5. Adjust R60 (Marked on the Receiver Test Cover) for a reading of $30\% \pm 5\%$ on the CRT AM display.

5-120. AM Detector

1. Select the Monitor FM Function and the Gen/Mon Mtr Display. Set the monitor frequency to 250 MHz, the RF Step Attenuator to the 0 dB position, and the BW Switch to the Wide position.
2. Connect the external signal generator to the RF In/Out Jack on the front panel. Adjust the external generator for a center frequency of 250 MHz at an output level of approximately -30 dBm and a calibrated 20 kHz FM.
3. Adjust R70 (Marked on the Receiver Test Cover) for a reading of 20 kHz ± 1 kHz on the CRT FM display.
4. Set the BW switch to the Narrow position and reset the FM on the external generator to 3 kHz deviation.
5. Adjust R125 (Marked on the Receiver Test Cover) for a reading of 3 kHz ± 150 Hz on the CRT FM display.

5-29

6. Turn off the FM on the external generator so that a CW signal of a level of approximately -30 dBm is applied to the R2001C.
 7. Connect the Demod Out Jack to the Vert/Sinad Dist/DVM/Counter Input Jack on the front panel. Select the DVM Display and the DC DVM Mode on the R2001C.
 8. Adjust R68 (Marked on the Receiver Test Cover) for a 0.0 VDC \pm 100 mVDC reading on the DVM Display.
- i-122. Spectrum Analyzer
1. Select the Monitor Function and the Spectrum Analyzer Display on the R2001C. Set the monitor frequency to 250 MHz, and the RF Step Attenuator to the 40 dB position.
 2. Connect the external signal generator to the RF In/Out Jack on the front panel. Adjust the external generator for a center frequency of 250 MHz and a calibrated output level of -30 dBm with no modulation.
 3. Adjust in succession C2, C83, C89, and C96 (Marked on the Receiver Test Cover) to maximize the amplitude of the spectral line in the center of the CRT display.
 4. Adjust R124, R91, and R100 (Marked on the Receiver Test Cover) to obtain a uniform change in the spectral amplitude per 10 dB change of the RF Step Attenuator. R124 affects the level of the spectral component when in the top quarter of the screen. R91 affects levels in the third quarter from the top, and R100 affects levels in the bottom quarter.
 5. Adjust R119 for offset and R121 for gain so that with the step attenuator in the 0 dB Position the peak of the spectral line lies on the 30 dB line of the CRT and that successive step increases of the input attenuator move the spectral amplitude downward in 10 dB increments on the CRT. The accuracy required for any one step attenuator position is \pm 3 dB.
 6. It will generally be necessary to repeat paragraphs 5-122.4 and 5-122.5 until the best possible accuracy is obtained.
 7. Turn the power off and remove the Receiver Module and the Receiver Extender for the chassis. Remove the Test Cover from the Receiver Module and replace the module cover. Reinstall the Receiver Module into the system chassis.

i-123. CHECKOUT PROCEDURE

i-124. Introduction

i-125. This section provides a system checkout procedure. This procedure will help isolate system failures when used with the troubleshooting information in para 5-143.

5-30

3. Move the Modulation Switch to the BURST position. Verify that a 133 Hz tone is output as long as the switch is held in the BURST position.
4. Select the Tone A Continuous Mode. Verify a Tone A output on the scope and at the speaker.
5. Select the Tone Remote Mode. Verify that when the Modulation Switch is moved from OFF to BURST that a single Tone Remote Access Sequence is generated.
6. Connect a microphone to the Mic Jack. Turn up the Ext Level Control and verify that speaking into the mike causes a modulation signal to be output as observed on the scope display.

5-133. Frequency Counter

1. Set the UUT to the Gen CW Mode with an output frequency of 35 MHz at a level of 0 dBm as displayed on the Gen/Mon Mtr display. Connect the RF In/Out Jack to the Counter In Jack of the UUT. Select the Frequency Counter Display and verify a frequency reading of 35 MHz.
2. Set the UUT to the Generate FM Mode and select the Gen/Mon Mtr Display. Turn the Code Synthesizer and Ext Modulation Sources OFF. Select the Narrow Band Mode and adjust the 1 kHz Level Control for a 5 kHz FM deviation reading. Connect the Mod Out Jack to the Counter Input Jack of UUT. Select the Frequency Counter Display and verify a nominal frequency reading of 1 kHz.

5-134. DVM

1. Maintaining the same conditions as in paragraph 5-133.2, select the DVM Display and the AC Mode on the Gen/Mon Mtr display. Verify a DVM reading of 0.707 vrms \pm 0.04 vrms.
2. Select the DC Mode and verify a near zero volt DC reading.

5-135. Scope Mode

1. Set the UUT to the Scope AC display mode and connect the scope vertical input jack to the Mod Out Jack. Enable the internal 1 kHz modulation source. Verify the operation of each position of the vertical input range switch and the vertical vernier gain control.
2. With the same connection as in paragraph 5-135.1, verify the operation of each position of the Horizontal Control and Horizontal timebase vernier.
3. With the Horizontal Control set to the External Mode, connect the External Horizontal jack to the Mod Out Jack. Verify a horizontal line whose length is variable with the Horizontal vernier.
4. Connect the Vert In Jack to the Mod Out Jack on the UUT. Set the vert and horizontal controls for a convenient display. Verify that a steady sine is observed in either the Norm or Auto modes and that the point of triggering is adjustable with the control. Remove the input signal and verify no horizontal sweep in the Norm mode and the presence of a horizontal sweep in the Auto mode.

5-136. Distortion/SINAD Meter

1. Set the UUT for the Generate FM Function, Narrow Band Mode, and the Tone Memory Display. On the Tone Table set Tone A for 2000.0 Hz.
2. Select the Gen/Mon Mtr Display and the Tone A Cont Modulation Mode. Turn the Ext Level and the 1 kHz Level Controls Off. Adjust the Code Synth Lvl Control for an FM deviation of 1.88 kHz as read on the CRT display.

5-32

5-126. Test Equipment Required

5-127. The test equipment listed in table 5-5 or its equivalent will be required to perform the checkout procedure.

Table 5-5. Test Equipment

*RF Signal Generator *RF Power Meter *SINAD Meter *Modulation Meter RF Power Source	Motorola R-1201A Motorola S-1339A Motorola R-1013A Boonton 82AD 1 watt to 100 watts
---	---

*An R2001 is suitable for use in place of these separate equipments.

5-128. Procedure

5-129. Power On

1. Check that the AC input power select card is in the 120 V position. Connect the Unit Under Test (UUT) to a 120 VAC line source with the front panel power switch off. Verify the presence of an AC indication on the front panel.
2. Set the power switch to the Standby Position. Verify the oven ready indicator is on.
3. Set the power switch to the on position. Verify that after a warm-up period a display is visible on the CRT.

5-130. Keyboard Check

1. Verify that each key has the proper effect by observing the Gen/Mon Mtr Display and entering the frequency 123.4567 MHz and the PL frequency 890. Check for proper cursor key operation.
2. Verify that the up and down display keys perform properly and that the LED at each display illuminates.
3. Verify that the up and down function keys perform properly and that the LED at each function illuminates.
4. Verify that the up and down modulation keys perform properly and that the LED at each modulation mode illuminates.

5-131. Nonvolatile Memory

1. Select a random combination of Display, Function, and Modulation Modes. Simultaneously depress both cursor keys and after a one second delay turn the system power OFF. Turn the system power back ON and verify that the same Display, Function, and Modulation Modes are present.

5-132. Modulation capability

1. Set the UUT to the Generate FM Mode and select the Gen/Mon Mtr Display. On the Gen/Mon Mtr Display enter a DPL code of 111. Select the Oscilloscope Display and connect the Mod Out Jack to the Vert In Jack. Set the code synthesizer to the Cont PL/DPL Mode. On the scope verify the presence of a DPL waveform whose amplitude is variable with the code synthesizer level control.
2. Move the Modulation switch from CONT to OFF and verify that a short burst of 133 Hz is output before the output stops.

5-31

3. Without disturbing the Code Synth Lvl Control, turn the Code Synthesizer OFF. Turn ON the 1 kHz Level Control and adjust for an FM deviation of 7.5 kHz on the CRT display.

4. Connect the Mod Out Jack to the SINAD Input Jack on the UUT. Verify a SINAD reading greater than 25 dB.
5. Set the Code Synthesizer to the Continuous Mode and verify a SINAD reading 12 dB \pm 1 dB.

5-137. Scan Mode

1. Set the UUT for the Gen/Mon Mtr display. Verify the proper operation of each of the RF Scan switch positions.

5-138. Generate Mode

1. Set the UUT for the Generate FM Mode at 200 MHz and select the Gen/Mon Mtr display. Verify an RF level output display on the CRT.
2. Connect the RF millivoltmeter with a 50 ohm termination to the RF In/Out Jack on the UUT. Set the RF step attenuator to the 0 dB position and adjust the Variable Level control to obtain a displayed output level of +13 dBm. Verify that the RF millivoltmeter reads +13 dBm \pm 2 dBm.
3. Repeat paragraph 5-138.2 except at a center frequency of 800 MHz.
4. Increase the RF Step Attenuator setting in 10 dB increments and verify that the displayed RF level decreases in 10 dB increments.
5. Set the Code Synthesizer Modulation switch and the Ext Level Control to their respective OFF positions. Select the Narrow Band mode and adjust the 1 kHz Level Control for a 5 kHz deviation reading on the CRT display. Verify a 1 kHz tone at the speaker output.
6. Connect the Modulation Meter to the RF In/Out Jack on the UUT. Set the Modulation Meter for a deviation display of 5 kHz \pm 250 Hz.
7. Select the Wide Band mode on the UUT and verify that the CRT displays a deviation of 20 kHz. Also verify that the Modulation Meter shows a peak deviation of 20 kHz \pm 1 kHz.
8. Select the Modulation Display on the UUT and verify a peak-to-peak modulation display of 40 kHz \pm 2 kHz.
9. Select the Generate CW Function and verify that no modulation is present on the CRT.
10. Set the UUT for the Generate AM Function, the Gen/Mon Mtr Display, and adjust for an RF output level of 0 dBm. Adjust the 1 kHz Level Control for a 50% AM reading on the CRT. Verify that the Modulation Meter reads 50% \pm 10% AM.
11. Select the Modulation Display and verify a low distortion 1 kHz sinewave.
12. Set the UUT for the Generate SSB/DSBSC Function and verify a low distortion 1 kHz sinewave on the CRT.
13. Set the UUT for the Generate SWP 1-10 MHz Function and the Scope DC Display. Verify a horizontal trace and a center frequency display on the CRT.
14. Set the UUT for the Generate SWP 0.01 - 1 MHz Function and verify the same results as paragraph 5-138.13.

5-33

i-139. Power Monitor Mode

- Set the UUT to the Power Monitor Mode. Set the RF Step Attenuator to the 30 dB position, and select the Gen/Mon Mtr Display. Connect the RF power source to the RF In/Out Jack. Key the power source and verify a correct power reading on the CRT display. Unkey the power source.
- Set the UUT to the Monitor Function and verify that the RF Step Attenuator is in the 30 dB position. Key the RF power source and verify the presence of an audible alarm and a warning display on the CRT. Unkey the power source.

i-140. Monitor Mode

- Set the UUT to the Monitor FM Function. Set the Squelch Control to the OFF position and verify the presence of a Sig Lvl indication and noise at the speaker. Turn the Squelch Control full on and verify the absence of a Sig Lvl indication and noise at the speaker.
- Repeat paragraph 5-140.1 except for the AM function.
- Repeat paragraph 5-140.1 except for the SSB/DSBSC Function and enable the BFO. After the test turn the BFO off.
- Select the Narrow Band FM Monitor Function at 300 MHz and set the RF Step Attenuator to the Full position. Connect the RF Signal Generator to the RF In/Out Jack and the SINAD Meter to the Demod Out Jack. Set the RF Signal Generator for a center frequency of 300 MHz and for 3 kHz FM at a 1 kHz rate. Adjust the RF output level from the Signal Generator for a 10 dB reading on the SINAD Meter. Verify that the Signal Generator's level is less than -103 dBm (1.5 Vrms).
- Calibrate the RF Signal generator for 3 kHz FM at 1 kHz rate using the Modulation Meter. Set the Generator for a nominal output level of -60 dBm and connect it to the RF In/Out Jack of the UUT. Select the Gen/Mon Mtr Display and verify a monitor deviation reading of $3 \text{ kHz} \pm 150 \text{ Hz}$.
- Calibrate the RF Signal generator for 50 kHz FM at 1 kHz rate. Select the Wide Band Mode on the UUT and verify a reading of $50 \text{ kHz} \pm 2.5 \text{ kHz}$ on the CRT deviation display.
- Calibrate the RF Signal generator for 30% AM at 1 kHz rate. Set the Generator for a nominal output level of -60 dBm and connect it to the RF In/Out Jack of the UUT. Select the Monitor AM Function and the Narrow Band Mode. Verify a monitor AM reading of $30\% \pm 5\%$.
- Monitor the % AM Displayed on the CRT while increasing the RF level out of the Signal Generator. Verify that the IF Overload Warning occurs before the displayed AM exceeds a reading of $30\% \pm 5\%$.
- Select the Modulation Display on the UUT and verify the presence of the received modulation signal.
- Select the Gen/Mon Mtr Display and the Wide Band Mode on the UUT. Vary the center frequency on either the UUT or the Signal Generator and verify that the Frequency Error Display properly represents the difference between the UUT's Center frequency and the Signal Generator's center frequency.
- Select the IF Display on the UUT and verify the presence of an IF envelope on the CRT.

5-34

5-141. Spectrum Analyzer

- Set the UUT for the Monitor Function at 300 MHz the Spectrum Analyzer Display, and 0 dB input attenuation. Connect the Signal Generator to the RF In/Out Jack on the UUT. Verify a spectral amplitude of $-30 \text{ dBm} \pm 5 \text{ dB}$ on the CRT display. Increase the RF Step Attenuator in 10 dB increments verifying that the spectral amplitude decreases by $10 \text{ dB} \pm 3 \text{ dB}$ with each step.

5-142. Duplex Generator

- Select the Duplex Generator Display and the Monitor Function at a frequency of 100 MHz. Enable the 45 MHz offset frequency. For an Image Low switch position verify that a displayed duplex frequency of 95 MHz can be obtained. Set the Image Switch to the HIGH position and verify a duplex frequency display of 145 MHz.
- Enable the 0 - 10 MHz offset frequency and verify that displayed duplex frequencies from 100 MHz to 110 MHz can be obtained.
- Set the UUT to the Generate Function with the Duplex Generator Display. With the Code Synthesizer and the External Modulation Sources OFF, adjust the 1 kHz Level Control for a 20 kHz FM deviation reading on the CRT. Select the Monitor Function and adjust the offset frequency for a duplex output of 100 MHz. Connect the Duplex Output Jack to the RF In/Out Jack and verify a 20 kHz $\pm 1 \text{ kHz}$ FM deviation reading on the CRT.

5-143. System Troubleshooting

- 5-144. A troubleshooting procedure is outlined in Table 5-6. Because of the complexity of the system the table covers only the major failures and provides only a guide to the most probable failed module. When using the table it is important to use the checkout procedure at paragraph 5-123 to determine the fault. The troubleshooting table assumes that all tests prior to the failure point have been successfully completed and thus the applicable circuits are okay.

- 5-145. A list of the system test points and their functions are provided in Table 5-7. Test points are identified on the block diagrams for the Theory of Operation discussion of paragraph 5-16 and for the Module Descriptions to aid in troubleshooting.

Table 5-6. System Troubleshooting

Test Paragraph	Fault	Troubleshooting Procedure
5-129	No AC indication	<ol style="list-style-type: none"> Check AC linecord and line fuse. If system powers up normally when on, Replace AC LED.
5-129	No Oven Ready indication	<ol style="list-style-type: none"> Check for approximately +15 VDC at E13 of the A13 module. If not present replace the Low Voltage Power Supply (A1). Check E11 of A13 for +9 VDC and E12 for approximately +7.5 VDC. If E11 is okay and E12 is 0 VDC, replace the LED. If the +9 VDC is not present on E11 replace A13.

5-35

Table 5-6. System Troubleshooting (Cont)

Test Paragraph	Fault	Troubleshooting Procedure
5-129	System won't turn on	<ol style="list-style-type: none"> Disconnect the high voltage supply from the low voltage supply at A10P1. Check for nominal voltages of 15 VDC at pin 3 of U2 on the low voltage supply and for +12 VDC at pin 8. If either voltage is not present replace the low voltage supply (A1). Reconnect the low voltage/high voltage interface and check for a nominal +9 VDC on the collectors of Q3 and Q4. (The actual signal on the collectors is a 0 VDC to +18 VDC square wave). If 9 volts is not present replace the high voltage supply (A10). If items 1 and 2 check okay replace the low voltage supply (A1).
5-129	System turns on, but no display on the CRT for any display mode	<ol style="list-style-type: none"> Check for presence of high voltage by disconnecting the CRT anode lead and arcing it to the chassis. If no arc, replace the high voltage supply. If the high voltage supply is okay, replace the CRT.
5-130	More than one key is inoperative or has the wrong effect	<ol style="list-style-type: none"> Replace the Processor Module (A9).
5-130 5-131	Only one key is inoperative	<ol style="list-style-type: none"> Replace the defective key switch. <p>WARNING Lithium Battery</p> <p>Do not mutilate or disassemble the battery cell. The lithium metal is a very active material that burns in the presence of water or high humidity. Do not put the battery in fire, attempt to charge, heat above 100°C, or solder directly to the cell. Do not overdischarge the cell to a reverse voltage greater than 3 volts. The battery may burst and burn or release hazardous materials.</p>
	Any part of the nonvolatile memory fails to remember	<ol style="list-style-type: none"> Troubleshooting Instructions: <ol style="list-style-type: none"> Turn system power switch off and disconnect the unit from the primary power source. Remove the Processor Module (A9) from the system and place on a non-conductive surface. With a voltmeter measure the DC voltage across the lithium battery in the lower left corner of the board.

5-36

Table 5-6. System Troubleshooting (Cont)

Test Paragraph	Fault	Troubleshooting Procedure
		<ol style="list-style-type: none"> If the battery voltage is less than 2.4 volts, the cell is discharged and should be replaced. If the battery is okay, replace the entire Processor Module (A9). If a new battery is needed, obtain a new cell (P/N60-80396A0) from Motorola. Replace the battery using the procedure in Part 2. <p>CAUTION Do not substitute another type lithium battery as a replacement. The specified battery was chosen with safety as a major consideration. Other lithium battery types may present a potential hazard when used in this system.</p>
		<ol style="list-style-type: none"> Replacement Instructions: <ol style="list-style-type: none"> Turn system power switch off and disconnect the unit from the primary power source. Remove the Processor Module (A9) from the system and place on a non-conductive surface. Cut each of the two wires connecting the battery to the circuit board near each battery end. Remove the battery from the hold-down clip. Remove the new battery from its shipping container and put the old battery into the shipping container. Dispose of the battery as per Part 3. With a 40-watt or lower watt soldering iron remove the old battery leads from the board. Using care not to short the battery leads to each other or to the battery case, install the battery into the hold-down clip with the negative lead nearest the left edge of the card (circuit board connector edge toward you). Solder the leads from the new battery into the printed wiring board at the points where the old leads were removed from. Trim the lead ends and reinstall the module into the system.

5-37

Table 5-6. System Troubleshooting (Cont)

Test Paragraph	Fault	Troubleshooting Procedure
5-132	No DPL (modulation) signal on CRT	<p>3. Disposal Instructions</p> <p>A. Do not dispose of the lithium battery by placing it in the everyday trash. Lithium batteries are classified as hazardous material and must be disposed of accordingly.</p> <p>B. Consult State and Local Codes for the appropriate procedure to be used for disposal.</p> <p>C. Motorola will dispose of the battery for you if you send it in the shipping container and by the same method that the new battery came to you:</p> <p>Motorola, Inc. Return Goods Department 1313 East Algonquin Road Schaumburg, IL 60196</p> <p>1. Check TP1 of the Audio Synthesizer for the presence of the DPL signal. If not present replace the Audio Synthesizer module.</p> <p>2. Check for the DPL signal on pin 64 of the Audio Synthesizer. If not present replace the IEEE interface module (A8), or check for the presence of the jumpers on JB for the standard unit.</p> <p>3. Check for the DPL signal at TP6 of the Audio Synthesizer. If not present replace the Audio Synthesizer (A6).</p> <p>4. Check for the DPL signal at TP4 of the Scope Amplifier module (A2). If not present replace the Scope/DVM control module (A3).</p> <p>5. If signal switching is okay to the Scope Amplifier module proceed to the scope troubleshooting information.</p>
5-132	No external modulation on the CRT	<p>1. Check for modulation signal at TP7 of the Audio Synthesizer module (A6). If not present replace the Audio Synthesizer module.</p>

5-38

Table 5-6. System Troubleshooting (Cont)

Test Paragraph	Fault	Troubleshooting Procedure
5-135	No horizontal sweep See "CAUTION" note on page 4-19	<p>1. Check for a voltage level between -2.0 VDC and +2.0 VDC at TP4 of the Scope Amplifier module (A2). If the voltage cannot be brought within range with either the vertical range attenuator or the vertical position control replace the Front Panel Interface module (A12).</p> <p>2. If the voltage at TP4 is okay replace the Scope Amplifier module (A2).</p>
5-135	No vertical display	<p>1. Check for the input signal at TP4 of the Scope Amplifier Module (A2). If not present replace the Front Panel Interface Module (A12)</p> <p>2. If signal is okay at TP4 replace the Scope Amplifier Module (A2).</p>
5-135	No vertical sync	<p>1. Check for the presence of sync pulses at pin 12 of the Scope/DVM Control module (A3) and for a nominal zero volt sync present level at pin 76. If either signal is not present replace the Scope/DVM Control module.</p> <p>2. If sync pulse and the sync present lines are okay replace the Scope Amplifier Module (A2).</p>
5-136	Distortion/SINAD meter inoperative	<p>1. If the DVM mode checks okay replace the Scope/DVM Control module (A3).</p> <p>2. If the DVM mode does not check okay go to the troubleshooting list for DVM AC inoperative.</p>
5-138	No generate output	<p>1. Remove the RF cable between the RF Synthesizer (A5) and the RF Input module (A11). Check for a nominal -10 dBm level at the Synthesizer output. If no output replace the RF Synthesizer.</p> <p>2. If the Synthesizer output is okay replace the RF Input module (A11).</p>
5-138	No Frequency Modulation	<p>1. Check for modulation signal at pin 56 of the RF Synthesizer (A5). If the signal is okay replace the RF Synthesizer.</p> <p>2. If the modulation signal is not present proceed to the troubleshooting list under "no DPL (modulation) signal on CRT".</p>

5-40

Table 5-6. System Troubleshooting (Cont)

Test Paragraph	Fault	Troubleshooting Procedure
5-133	Frequency Counter inoperative	<p>2. Check for the modulation signal on pin 66 of the Audio Synthesizer. If not present replace the IEEE Interface module (A8), or check for the presence of the modulation jumpers on JB for the standard unit.</p> <p>3. Continue troubleshooting at step 3 of the "no DPL signal on the CRT".</p>
5-133	DVM AC mode is inoperative	<p>1. Check for presence of a 1 kHz signal at TP9 of the Audio Synthesizer (A6). If not present check for the 10 MHz signal from the Frequency Standard module (A13) to the RF Synthesizer (A5). If present replace the RF Synthesizer. If not present replace the Frequency Standard module.</p> <p>2. If the 1 kHz signal is present check for the presence of the signal to be counted at pins 61 and 63 of the processor I/O module (A7). If not present replace the Front Panel Interface Module (A12).</p> <p>3. If signal is okay up to the Processor I/O module replace the Processor I/O module.</p>
5-134	DVM DC mode is inoperative	<p>1. Check for DVM signal at pin 22 of Front Panel Interface module (A12). If not present replace the Front Panel Interface module.</p> <p>2. Check for short bursts of the DVM AC signal at TP2 of the Scope/DVM Control module (A3). If signal is not present at TP2 replace the Scope/DVM Control module.</p> <p>3. If the signal is okay to TP2 of A3, replace the Processor I/O module.</p>

5-39

Table 5-6. System Troubleshooting (Cont)

Test Paragraph	Fault	Troubleshooting Procedure
5-139	Internal wattmeter in error	1. Replace RF input module (A11).
5-140	No monitor function	<p>1. Apply a 10.7 MHz modulated carrier to the RF input. Check for normal receiver operation except reduced sensitivity. If receiver is not working replace the Receiver module (A4).</p> <p>2. If the receiver checks okay and the generate function is okay, replace the RF Input module (A11).</p>
5-140	Monitor frequency error display is missing	1. Go to the troubleshooting list under "frequency counter inoperative".
5-140	Monitor frequency error is in error	<p>1. Check for presence of IF signal at pin 91 of the Scope/DVM Control module (A3). If not present replace the Receiver module (A4).</p> <p>2. If the IF signal is present replace the Scope/DVM Control module.</p>
5-141	No spectrum analyzer sweep	<p>1. Check pin 6 of the RF Synthesizer module (A5) for a 50 Hz square wave. If not present replace the RF Synthesizer module.</p> <p>2. If 50 Hz signal is present replace the Scope/DVM Control module (A3).</p>
5-141	Spectrum display is in error	1. Replace the Receiver module (A4).
5-142	No duplex output	1. Replace the RF Input module (A11).

5-41

Table 5-7. Test Point Identification

Test points are located near the top edge of the card and counted from left to right when facing the component of the card.

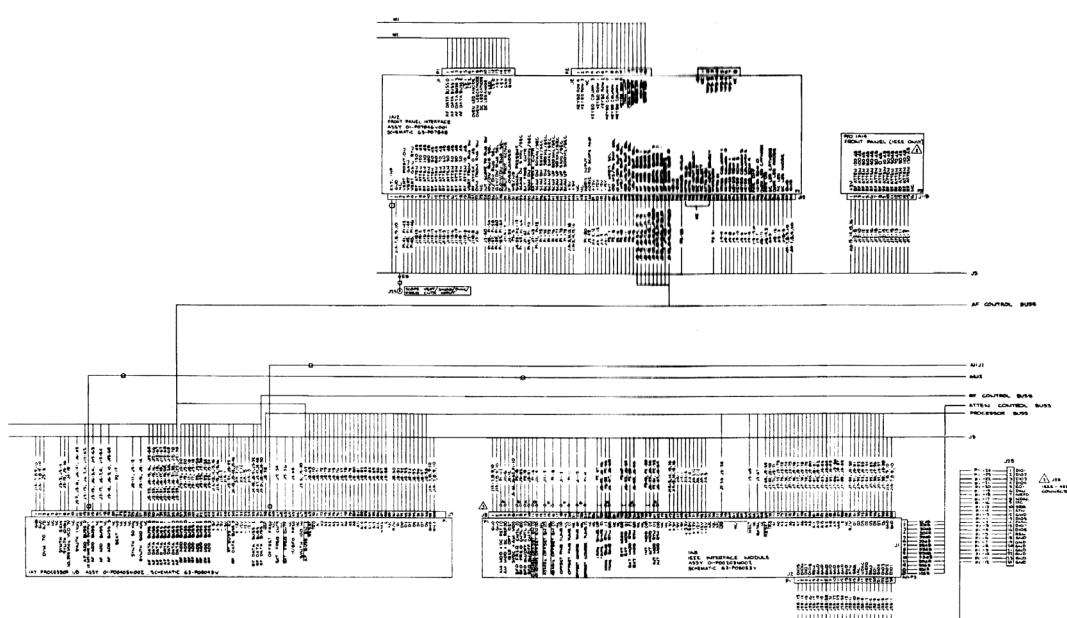

Module	Test Point No.	Signal Name
A1		
Low Voltage		
Power Supply		
A1A1	101	Pulse Width Mod Out
	102	Pulse Width Mod Dr
	103	HV Source Voltage
A1A2	201	Ground
	202	+5V FB
	203	-5V

SECTION 7

LOW VOLTAGE POWER SUPPLY (A1)

7-1. GENERAL. The low voltage power supply (figure 7-1) converts an AC line voltage input or a DC voltage input to the required DC operating voltages. The power supply is composed of four modules, each module containing a printed wiring board. These modules are the relay, control, switcher, and output modules. Protection circuits protect the power supply against short circuits, high internal temperatures, and high and low DC bus voltages.

7-2. INPUT POWER CONTROL. When AC power is applied to the power supply, the output of the AC rectifier and filter circuit provides the DC bus voltage. An AC sense circuit provides a control voltage when AC power is present. This control voltage isolates the DC voltage input from the DC bus and drives the front panel AC indicator.

7-3. The off, standby, or on operating mode of the power supply is selected by the control circuit. When the analyzer is off, the frequency standard and chopper generator are off, and the battery charger is on. When the analyzer is in standby, the chopper generator is off and the frequency standard and battery charger are on. When the analyzer is on, the frequency standard and chopper generator are on and the battery charger is off. Thus, the battery is charged when the analyzer is in the off and standby modes of operation. The frequency standard operates in the standby and on modes of operation.

7-4. The battery charger requires a voltage higher than the nominal DC bus voltage. This increased voltage, 32V, is provided by the AC boost circuit.

7-5. To operate the power supply using a DC voltage input, the AC power input must be removed, disabling the AC sense voltage. When the AC power is removed and the analyzer turned off, no power is present on the DC bus. When the analyzer is switched to the standby mode, the DC relay closes, connecting the DC voltage input to the DC bus and the supply voltage to the frequency standard. When the analyzer is switched on, the chopper generator is enabled and normal operation occurs.

7-6. DC OUTPUT CONTROL. Regulation of the DC output voltages is accomplished by using the +5volt output as feedback. This feedback voltage is compared to a stable reference voltage (7.9V). The resultant control voltage determines the on time of the pulse width modulator, thus regulating the input voltage to the chopper circuits. The output transformer winding ratios determine the output voltages with respect to the +5-volt feedback.

7-7. The chopper generator provides a 7-volt reference voltage, a 20-kHz squarewave chopper drive signal, and a 20 kHz triangular waveform. The pulse width modulator has a 50 percent duty cycle. For control voltages that are above or below the mean DC voltage of the triangular waveform, the duty cycle is proportionately increased or decreased.

7-8. The filtered DC output from the pulse width modulator is chopped 50 percent through the primary windings of output transformer T2 at a 20 kHz rate. The DC output is alternately switched between each half of the primary winding of T2. Current through the primary winding center tap is passed through a current transformer whose output is used for overcurrent protection.

7-9. PROTECTION CIRCUIT. This power supply is protected from shorted outputs, high internal temperatures, and high or low DC bus voltage. In each case, the protection circuit pulls the control voltage line low, disabling the pulse width modulator and shutting down the power supply outputs.

10. Short circuit protection is provided by monitoring the current in the primary winding of the output transformer T201. When the current exceeds a programmed level, the overcurrent detector pulls the control voltage line low, disabling the pulse width modulator and shutting down the output. With the output shut down, there is no primary winding current, causing the control voltage line to be released. When the control voltage line is released, the pulse width modulator is again enabled and the power supply outputs are available again. If the short circuit is still present, the shutdown sequence will be repeated. A delay is provided in the overcurrent detector causing the shutdown sequence to cycle at an approximately 0.5 second rate.

11. Over temperature protection is provided by a thermal switch. When the temperature of the power supply reaches the setting of the thermal switch, the switch closes, pulling the control voltage line low, disabling the pulse width modulator and shutting down the power supply outputs. Normal power supply operation will resume when the temperature returns to a safe operating level.

12. Protection against high or low DC or AC line inputs is provided by monitoring the DC bus voltage. When the DC bus voltage exceeds 20 volts, or falls below 10 volts, the high/low shutdown circuit pulls the control voltage line low, disabling the pulse width modulator and shutting down the power supply outputs. When the DC bus voltage returns to normal, the power supply will automatically resume normal operation.

13. **HIGH VOLTAGE CONTROL**. The HV BIAS V line and the HV SOURCE V line provide the high voltage power supply A10 with bias voltage at primary power, respectively.

14. **SWITCHER MODULE A1A1**. The switcher module (figure 7-4) contains the pulse width modulator and chopper circuit. The input PWM DRIVE signal, from the control module, switches the chipping circuit on and off. This produces a rectangular wave output which is filtered and applied to transformer choppers A and B. In effect, this action regulates the voltage which is applied to transformer T201 at the output module. The PWM OUT signal is a secondary input to the voltage regulator/comparator on the control module.

15. Transformer choppers A and B are driven by CHOPPER DR A and CHOPPER DR B signals from the control module. Output signals XFMFR DR A and XFMFR DR B are 180° degrees out-of-phase and XFMFR DR A1 and XFMFR DR B1 are 180° degrees out-of-phase. An output, HV SOURCE V, from the chipping circuit is the primary power source for the high voltage power supply.

16. **OVP (Overvoltage Protection)**. The OVP zener is connected to the +5V output from the output module and sets the maximum +5 volt level to +6.3 volts.

17. **OUTPUT MODULE A1A2**. The output module (figure 7-8) provides the regulated output voltages and the current sense voltage for the overcurrent protection circuit. Input power is provided by signals XFMFR DR A, A1, B, and B1. These signals are 20 kHz squarewaves and drive the primary windings of transformer T201. After full wave rectification and filtering, the nominal output voltages are available as shown in figure 7-8.

18. The primary current of transformer T201 is monitored by transformer T202. The voltage developed across T202 is full wave rectified and applied to the current limit circuit on the control module by the CURRENT LIMIT SENSE signal. An increase in the primary current of T201 produces a corresponding increase in the voltage developed across T202. This increase is applied to the current limit circuit and overcurrent protection is initiated.

19. Regulation of the output voltage is accomplished by the +5-volt feedback. When the +5-volt output is regulated, the remaining output voltages will be regulated because of the turns ratio of the windings between the outputs. When the +5-volt output is held to one percent regulation, the other outputs will be held to five percent regulation.

20. The OVP (Overvoltage Protection) output is applied to a 6.2-volt zener diode mounted on the chopper assembly. It provides overvoltage protection to the +5-volt output.

7-21. **CONTROL MODULE A1A3**. The control module (figure 7-11) provides pulse width modulation control and contains the protection circuits. Pulse width modulation control is accomplished by comparing a 7.9V reference voltage to the +5-volt feedback from the output module. The resultant integrated control voltage is applied to the pulse width control. The voltage is compared to the 20 kHz triangle voltage to determine the duty cycle of the pulse width modulator. The chopper drive outputs are squarewaves and are 180° degrees out-of-phase with each other.

7-22. When the DC BUS voltage is over 20 or under 10 volts DC, the over/under voltage protection circuit pulls the control voltage signal to the pulsedwidth control circuit low. This action shuts down the pulsedwidth modulator.

7-23. The soft start circuit slows the rise time of the control signal to the pulsedwidth control circuits. When the signal reaches the operating level the soft start circuit is switched out of the control loop.

7-24. The overcurrent detector compares a signal that is proportional to the current in the current transformer, to a reference. When the current is too high, the control signal is pulled low, shutting down the output module. After a delay, the output module operates again, if the malfunction causing the overcurrent is still present, the module will shutdown again. The sequence will cycle at a 0.5 second rate until the malfunction is corrected.

7-25. When the internal temperature of the power supply rises above 85°C, the overtemp shutdown circuit uses the control signal to go low, shutting down the pulsedwidth control circuit. The control logic functions are shown in table 7-1.

Table 7-1. Control Logic Functions

Input Signals		Output Signals				
Pwr On	AC Sense	Batt Chr Enable	HV Bias Supply V	AC Led	DC Led Anode	Relay Enable*
Low	Low	High	On	Off	On	Low
Low	High	Low	On	On	Off	High
High	Low	Low	Off	Off	Off	Low
High	High	High	Off	On	Off	High

*Note that RELAY ENABLE low does not imply that the relay is closed. The PWR OFF signal on the relay module must also be high to close the relay.

7-26. **RELAY MODULE A1A4**. The relay module (figure 7-14) is mounted on one end plate of the power supply. Power is supplied to the relay module from the DC BUS. When the RELAY ENABLE line is high, the relay is open, and the power supply operates from the AC input. The MAIN AC and MAIN AC lines receive a 13.5-volt AC rms input from the line transformer. After full wave rectification, the DC power is routed throughout the power supply on the DC bus. Filtering of the DC power is done on the switcher module.

7-27. When the DC input is used, the RELAY ENABLE line is low, the relay is closed, and the power supply operates from the DC input. The battery charge voltage is boosted to 32 volts using the AC bus voltage to bias an AC boost winding center tap.

SECTION 8

SCOPE AMPLIFIER (A2)

8-1. General. The Scope Amplifier module contains the horizontal and vertical deflection amps, the horizontal timebase generator, focus and intensity control circuitry, and miscellaneous CRT bias adjustments. A block diagram of the Scope Amplifier module is shown in figure 8-1 with its schematic shown in figure 8-2.

8-2. Deflection Amplifiers. The vertical and horizontal deflection amplifiers are identical. The input signal is initially amplified and split into two signals 180° out of phase. Each of the two signals is then further amplified to become the CRT deflection plate signals. The amplifiers provide up to 200 volts peak-peak signal capability with a 1 MHz frequency bandwidth.

8-3. Horizontal Timebase Generator. The horizontal timebase generator provides calibrated sweep rates over a six decade range from 1 μ sec to 100 msec per division. Sweep rate selection is from the processor via the SCOPE SWP CONT 0-7 signal lines. Vernier control over the sweep rate is via the SWP VERN VOLT input from the front panel. Sweep triggering is either the auto or normal mode as selected by the AUTO/NOR TRIG SEL line from the front panel. In the auto mode, if the SYNC PRESENT input is high indicating no sync, the scope sweep is self triggered after a hold off time. If there is a sync present, the sweep will wait for a pulse on the TRIG PULSE line to start the sweep after the hold off time. For the normal trigger mode the sweep will always wait for a TRIG PULSE input.

8-4. A sweep cycle consists of two parts, the sweep and the hold off. During the sweep the CRT is unblanked via the SWP BLANKING line and the horizontal trace is made. At the end of the sweep the CRT is blanked and the hold off time begins. During the hold off time, which is equal to the sweep time, the sweep generator and trigger circuits are reset in preparation for the next sweep.

See "CAUTION" note on page 4-19

8-5. Horizontal Switching. The input to the horizontal deflection amp is selected between two sources. The INT HORIZ IN signal line provides the horizontal character sweep and the horizontal spectrum analyzer sweep. The other source is the scope mode signal path from the horizontal positioning summing amp. The scope mode signal is either the output of the Horizontal Timebase Generator or the EXT HORIZ INPUT from the front panel. Selection between internal horizontal and scope mode horizontal inputs is via the SCOPE MODE EN line from the processor. Selection between the two scope mode signals is via the EXT HORIZ EN line.

8-6. Intensity Control. A crossover network is used to provide CRT Z-axis modulation from DC to 1 MHz. The INTEN LVL signal from the front panel control is gated with the SCOPE Z-AXIS signal by the intensity Level Gate. The gated signal is summed with the HV REF and INTEN SMPL VOLT signals to provide the INTEN TV signal. The INTEN TV (Intensity Tracking Voltage) is the low frequency control path which drives the intensity optoisolator in the High Voltage Supply.

8-7. The high frequency modulation path is via the Z-Axis Modulator circuit. The resulting CRT Z-AXIS signal is capacitively coupled to the CRT grid.

8-8. Focus Control. The FOCUS TV (Focus Tracking Voltage) signal is obtained by comparing the FOCUS LEVEL control line to the FOCUS SAMPLE VOLT signal. The tracking voltage signal drives an optoisolator circuit in the High Voltage Supply which controls the CRT focus voltage.

8-9. Astigmatism, Geometry, and Trace Rotation. These three CRT alignment controls are obtained from the respective wipers of three potentiometers. Each potentiometer is connected between supply voltages equal to the adjustment range required.

SECTION 9

SCOPE/DVM CONTROL MODULE (A3)

9-1. General. A primary function of the Scope/DVM Control Module is to route the required measurement and viewing signals to the DVM and scope circuitry. A large portion of the displayed data is determined by the DVM measurements on internal signal points. Thus for a rapid update of several data displays it is necessary to time division multiplex several measurements points to the DVM. The DVM control circuitry and the system processor provide this function.

9-2. The scope control circuitry allows the system to display data information, internal modulation or demodulated signals, and external scope inputs as selected by the user. Provisions are also made for external horizontal inputs and a horizontal sweep that is coherent with the sweep generator for spectrum analyzer and filter alignment displays.

9-3. The control module also contains circuitry for single sideband demodulation and a IF phase locked loop for filtering and waveshaping the IF signal for frequency counting. A block diagram of the Scope/DVM Control module is shown in figure 9-1 with a schematic shown in figure 9-2.

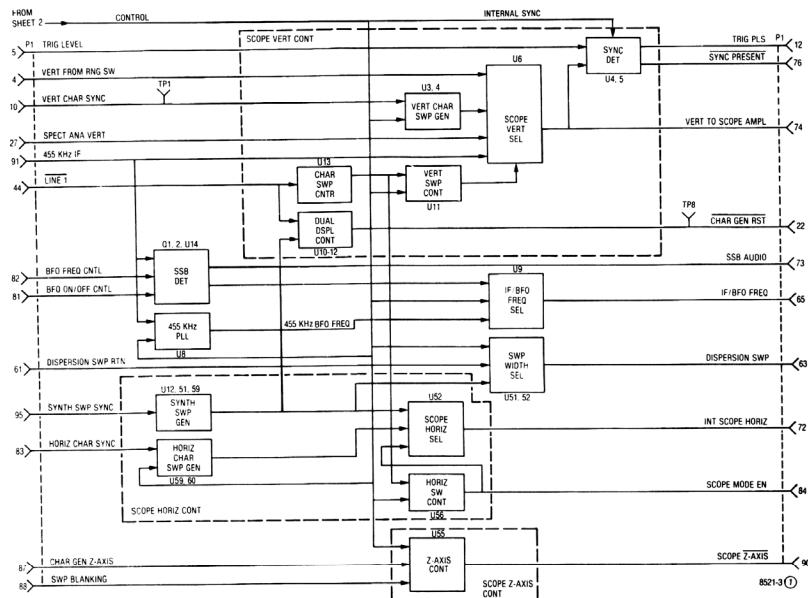

9-4. Scope Vertical Control. The input to the scope vertical amplifier is switched between four different sources: the range switch (VERT FROM RNG SW), the vertical character sweep, the spectrum analyzer (SPECT ANA VERT), or the 455 kHz IF. Range switch inputs are from either the scope vertical input jack on the front panel or the internal modulation signals as selected by the modulation display control on this module. The vertical character sweep is a sawtooth waveform generated by the Vertical Character Sweep Generator and synced by the VERT CHAR SYNC signal from the character generator. The detected and amplified output of the receiver logarithmic IF is the vertical input for the spectrum analyzer. The remaining signal source is the second IF signal from the receiver for IF envelope observation.

9-5. For the spectrum analyzer and the scope sweep displays the Dual Display Control and Character Sweep Counter circuitry allow a single row of characters at the top of the CRT. This function is implemented with the Vertical Sweep Control by alternating the spectrum analyzer or the range switch signal with the vertical character sweep signal.

9-6. The dual display sequence of events starts with the Synthesizer Sweep Generator which is common to both display modes. When the synthesizer sweep is near its peak (scope horizontal sweep is at the edge of the screen) the Dual Display Control activates the CHAR GEN RST line and switches the scope vertical and horizontal inputs to their character generator sweeps. When the first character line has been traced, a transition on the LINE 1 input from the character generator resets the character generator sweeps and the character generator, increments the Character Sweep Counter, and thus causes line 1 to be traced again. This process repeats until four traces, as counted by the Character Sweep Counter, have been completed. At that point the counter resets the scope inputs back to the spectrum analyzer or range switch input. During the character display time the synthesizer sweep generator is reset and held until a transition on the SYNTH SWP SYNC line restarts the sweep. The timing of the process allows for the four character traces to be completed before the sweep sync occurs.

9-7. SSB Detection. Single Sideband (SSB) modulation is recovered by multiplying the 455 kHz IF signal with a 455 kHz beat frequency oscillator (BFO) signal. The BFO is controlled directly from the front panel and is adjustable over a 6 kHz frequency range. SSB AUDIO from the multiplier is routed to the receiver for post detection filtering. A sample of the BFO signal is made available to the frequency counter on the IF/BFO FREQ line for sideband frequency error determination.

9-8. 455 kHz PLL. For monitor frequency error determination a 455 kHz Phase Locked Loop (PLL) is used to filter and to shape the IF signal. The cleaned up signal is switched with the BFO signal to the frequency counter.

9-9. Scope Horizontal Control. Switching for the scope horizontal input is divided between two modules. The time base generator and the external horizontal input are selected on the scope amplifier module. The Horizontal Character Sweep Generator and the Synthesizer Sweep Generator signals are selected on the Control Module to the INT SCOPE HORIZ signal line.

9-10. For the dual display modes (characters and synthesizer sweep) the Horizontal Switch Control switches the horizontal input between the synthesizer sweep and the character sweep. This switching occurs simultaneously with that occurring in the scope vertical control as described in paragraph 9-6. The Horizontal Switch Control also provides the SCOPE MODE EN line to the scope amplifier to enable the scope mode horizontal inputs.

9-11. Synthesizer Sweep Control. The sweep signal generated by the Synthesizer Sweep Generator is controlled in amplitude and in range across the front panel sweep width control. Attenuations of 1.0 or 0.1 are provided by the Sweep Width Selector switch to the sweep signal at the DISPERSION SWP signal line to the top of the width control. The attenuated signal is inverted and returned to the Sweep Width Select circuit via the DISPERSION SWP RTN line. A 10 to 1 resistor change is made in the return line simultaneously with the attenuator change to give sweep widths of 1.1 MHz and 0.031 1 MHz.

9-12. Scope Z-Axis Control. The SCOPE Z-AXIS signal has three possible sources as selected by the Z-Axis Control circuit. For character displays the Z-Axis signal is the CHAR GEN Z-AXIS from the character generator. The SWP BLANKING signal from the horizontal timbase generator is switched to the scope Z-Axis for the scope modes. For the remaining modes, scanstart, scanstop, and range switch, a logic level is input to the Z-Axis source.

9-13. Modulation Display Control. Internal modulation or demodulated signals are displayed on the scope by switching the desired signal source to the input ranging switch and then switching the ranging switch output to the scope vertical input. The INTERNAL SCOPE AND PEAK DETECTOR SELECT circuitry switches DEMOD CAL AUDIO OR AM CALAUDIO TO MOD LEVEL or MOD CAL AUDIO to the internal scope and the peak detectors. The signals are gain controlled before exiting the module from the INT SCOPE TO RANGING SWITCH output pin. The gains are controlled by the control voltage.

9-14. The DEMOD CAL AUDIO signal from the receiver is either AM, FM, or SSB as determined by the operating mode. The peak signal level on this line is calibrated to 10 kHz/volt for FM and 10% /volt for AM. SSB signals are not included.

9-15. For AM the CARRIER + MOD LVL input from the generator output detector provides a direct display of the modulation. This input is a DC level representative of the average output level plus an AC signal representative of the amplitude modulation on the output. For the scope modulation display the DC level is blocked so that only the AC component is observed. This input is uncalibrated for absolute AC levels, but the processor by determining the peak AC and average DC levels can determine the modulation depth.

9-16. For FM the MOD CAL AUDIO input from the audio synthesizer is calibrated to 5 kHz/volt for narrow band and to 20 kHz/volt for wide band. Correspondingly the display calibration attenuator has two gain ranges to maintain the same display calibration for both narrow and wide band.

9-17. Peak Detector. Each of the modulation and demodulation inputs can be selected to the peak detecting circuitry for the determination of % AM or kHz deviation. The peak detector circuitry provides DC outputs equal to the negative and positive peak values of the input signal relative to the average DC level of the signal. These levels are

9-18. DVM Control. Any one of nine internal measurement points may be switched to INT DVM TO A/D. This signal is routed to the A7 (processor interface board) where it is multiplexed with external DVM data to the input of the internal analog to digital (A/D) converter. In general several internal measurement points may be input to the A/D converter.

to obtain all of the displayed data. Therefore the processor continuously cycles the INTERNAL DVM SELECT through the required measurement points stopping at each one long enough to digitize and input the data to the microprocessor.

9-19. The Internal DVM Select switch is followed by a range attenuator. As the processor cycles through the inputs it sets the range attenuator according to the last cycle reading made at that input. Thus each internal input is averaged over two decades to give three digit accuracy up to a maximum input of 10 volts. The internal DVM inputs and their function are listed in table 9-1.

Table 9-1. Internal DVM Inputs

+ Peak Voltage	Positive modulation measurements
- Peak Voltage	Negative modulation measurements
Carrier Level	RF output level
RF INPUT PWR	Power level applied to the RF input/output port
EXT FWD PWR	Forward power level on external inline wattmeter element
EXT RFL PWR	Reflected power level on external inline wattmeter element
BATT VOLT	Voltage level at DC input jack on the rear panel divided by 10
TEMP SENS VOLT	+5V level signal the processor that the RF load temperature is too high
SINAD/DISTORTION IN	D ₁ level proportional to the signal power at the input of the SINAD/DISTORTION NOTCH Filter

9-21. External DVM/Distortion Control. External DVM and distortion inputs to the front panel jack are ranged by microprocessor control over four decades at the A12 (front panel interface) module. The resulting output is routed to the DVM/FROM RNG SWITCH input of the A3 module. The signal is input to the DVM/DISTORTION SELECT circuitry and the gain of 6.5 preceding the 1 kHz notch filter.

9-22. Distortion Measurement. In the distortion mode the DVM/DISTORTION SELECT circuitry routes the output of the 1/2 kHz notch filter to the EXT. DVM or ADD output pin where it is connected to the RMS to DC converter on the microprocessor module. The output of the 1/2 kHz to DC Converter is multiplexed to the A/D and read by the microprocessor. This input signal is then fed into the digital integrator of the INT/DVM to read the RMS value for reading by the microprocessor (refer to paragraph 9-19). The microprocessor divides the RMS output voltage of the notch filter by the average rectified input voltage to the notch filter to obtain the percent distortion for a 1 kHz input. The notch filter has a microprocessor controlled gain that is switched to either one times or times ten depending on input distortion and signal levels.

9-23. EXTERNAL DVM MEASUREMENT. In the external DVM mode the DVM FROM RNG SWITCH input is routed by the DVM/DISTORTION SELECT circuitry directly to the EXT DVM TO A/D output where it is connected to the RMS to DC converter on the A7 (microprocessor interface) module. The output of the RMS to DC converter is then multiplexed to the A/D converter where it is read by the microprocessor.

9-24. Module Control. Processor control of the Scope/DVM Control module is via the AF ADD BUS 0-3, the AF DATA BUS 0-3, and the AF BUS EN 1 signal lines. The four address bits are decoded by the Address Decode to determine which Control Latch the four bits of data will be latched into. The latching process is synchronized by the enable line. Control latches in addition to those necessary for controlling the module provide control for the Scope Amplifier gain/level control of the BEAM input module.

Ampline module and part of the HI-Input module.

SECTION 10 RECEIVER (A4)

10-1. General. The Receiver down converts the 10.7 MHz first IF signal to 455 kHz. Following the down conversion a linear or a logarithmic IF amplifier provide the gain prior to AM and FM detectors or the spectrum analyzer detector respectively. Post detection filtering provides the wide or narrow band responses for the audio outputs. The audio amplifier for the speaker and the alarm generator are also contained on this module. A block diagram of the Receiver is shown in figure 10-1 and its schematic in figure 10-2.

10-2. Down Converter. The 10.7 MHz IF signal is converted to 455 kHz by mixing with a 10.245 MHz local oscillator. The local oscillator is phase locked to the system 10 MHz frequency standard. A sample of the 10.245 MHz VCO signal is output to the Processor I/O module. There the VCO signal is mixed with 10 MHz, the difference is divided by 49, and the result compared with a 5 kHz reference obtained from the 10 MHz. Any frequency difference causes a correction to be made to the VCO frequency via the 10.245 MHz VCO TV line through the Loop Filter.

10-3. The IF filter following the mixer provides the selectivity for the system. Two bandwidths, ± 100 kHz wideband and ± 13 kHz narrowband, are processor selectable to correspond the front panel bandwidth control.

10-4. Linear IF Amplifier and Detectors. The linear IF Jmplifier amplifies the 455 kHz signal to the AM and FM detectors. The DC signal from the AM detector is fed to the AGC Amplifier and Squelch Detection circuitry. There it is compared to the AGC reference with the resulting AGC signal controlling the gain of the IF Amplifier. For signal present indication and squelch operation the SQUELCH LVL from the front panel is compared to the AGC voltage. When the AGC voltage falls below the squelch level, indicating a strong signal, the SIG PRESENT line is activated. With the SIG PRESENT active the audio is allowed through the select switch and the signal present light on the front panel is illuminated. To warn the operator when the IF input level is beyond the linear range of the IF amplifier, the AGC voltage is also compared to a fixed IF overload level. When this level is exceeded, the IF OVLD line is activated causing the processor to flash the warning on the CRT display.

10-5. The AC component from the AM detector is buffered by the Audio Buffer and then passed to the Audio Select switch. The lower 3 dB corner on the AM audio response is approximately 100 Hz.

10-6. Frequency modulation is recovered by a dual bandwidth phase locked loop discriminator. The bandwidth, wide or narrow, is selected coincident with the IF Filter bandwidth. Audio from the discriminator is applied to the Audio Select switch.

10-7. A 455 kHz Buffer amplifier provides an interface between the IF Amplifier output and the IF processing circuits on the Scope/DVM Control module.

10-8. Audio Switching and Filtering. The output of the AM or FM detector or the SSB AUDIO signal from the Scope/DVM Control module can be selected as the demodulated audio output. Selection is made by the processor depending on the operating mode and the presence of the active state on the SIG PRESENT line. If the SIG PRESENT line is not active, the Audio Select switch is opened squelching the audio signal.

10-9. The Audio Filter provides either wide or narrow band filtering on the recovered audio. For wideband a 0.5 dB bandwidth of 100 kHz is provided while narrowband has a 0.5 dB bandwidth of 3 kHz. The output of the filter is separately buffered to three signal lines. The DEMOD CAL AUD signal is used on the Scope/DVM Control module for modulation determination, the DEMOD OUT signal goes to the front panel jack, and the VOL CNTL AUD provides the drive to the speaker audio amplifier.

10-10. Logarithmic Amplifier and Detector. For the spectrum analyzer function the logarithmic IF amplifier processes the input signal level over an 80 dB range. The Amplifier is composed of four 20 dB sections summed together. Amplitude detection at the output of the amplifier provides the SPECT ANA VERT signal to the Scope/DVM Control module.

10-11. Alarm Generator and Audio Amplifier. An astable multivibrator operating at 1.2 kHz is the Alarm Generator. The Alarm signal is controlled by the processor and is summed with the VOL CNTL AUD RTN signal at the input of the Audio Amplifier. The SPKR AUD output of the amplifier has 0.5 watt capability and is connected directly to the system speaker.

10-12. Module Control. Address decoding for the two control latches on this module is performed on the Synthesizer module. The two decoded lines, RF LCH ADD 13 and RF LCH ADD 14, determine which Control Latch the four bit data bus, RF DATA BUS 0-3, will be stored.

SECTION 11

RF SYNTHESIZER (A5)

11-1. General. The RF Synthesizer provides an RF signal source for the frequency range from 10 kHz to 1 GHz in 100 Hz steps. The output frequency is programmed by the processor through the RF control bus and is phase locked to the 10 MHz frequency standard. A reference divider in the module produces outputs of 500 kHz, 50 kHz, 5 kHz, 1 kHz, 100 Hz, and 50 Hz (SYNTH SWP SYNC) each having the same accuracy as the frequency standard. A block diagram of the RF Synthesizer is shown in figure 11-1 and its schematic is shown in figure 11-3.

11-2. Frequency Synthesis Scheme. Four phase locked loops are used to generate the output frequency; a 60.5 MHz loop, a 310-440 MHz loop, the 500 MHz-1000 MHz loop, and the 550 MHz loop. Two of these loops contain programmable dividers, controlled by the microprocessor for varying the frequency. The 310-440 MHz loop is controlled by the four most significant digits of the required frequency and operates in discrete 50 kHz increments. The 60.5 MHz loop is controlled by the three least significant digits of the required frequency and operates in discrete 50 Hz increments.

11-3. The output is derived from three sources, covering the ranges of 10 kHz to 250 MHz, 250 MHz to 500 MHz, and 500 MHz to 1000 MHz. In the first range, 10 kHz to 250 MHz, the output is derived by mixing the fixed 550 MHz signal with 500-1000 MHz signal programmed for frequencies from 550.01 MHz to 800 MHz. For the second range, 250 to 500 MHz, the output is a divide by two of the 500-1000 MHz signal. The final range is the 500-1000 MHz signal directly. The appropriate frequency source is switched to the SYNTH RF output of the Output Select switch.

11-4. A basic flow diagram for programming the RF Synthesizer is shown in figure 11-2. This diagram includes generate and monitor considerations, wideband amplifier control, and modulation control.

11-5. 310-440 MHz Phase Locked Loop. A single 310-440 MHz VCO is phase locked to the 100 kHz reference input using a straight forward loop. The VCO output is divided down to 50 kHz using a programmable two modulus prescaler and divider. Programming of the divider is controlled by the processor to give output frequencies from 310 to 440 MHz in 50 kHz steps.

11-6. 60.5 MHz Phase Locked Loop. The 60.5 MHz loop is programmable over a ± 100 kHz range in 50 Hz increments. The 60.5 MHz VCO output is mixed with a 50 MHz signal from the 550 MHz loop. A programmable divider following the mixer divides the 10.5 MHz ± 100 kHz signal down to the 50 Hz reference frequency. A comparison between the divider output and the reference signal by the Phase/Frequency detector results in an error voltage to the VCO which maintains the phase lock.

11-7. 550 MHz Phase Locked Loop. A fixed frequency of 550 MHz is obtained by dividing the 550 MHz VCO by 55 to obtain 10 MHz. The 10 MHz from the divider is compared with the 10 MHz frequency standard in the Phase/Frequency Detector. The resulting error signal is filtered and used to correct the 550 MHz VCO to maintain it in lock.

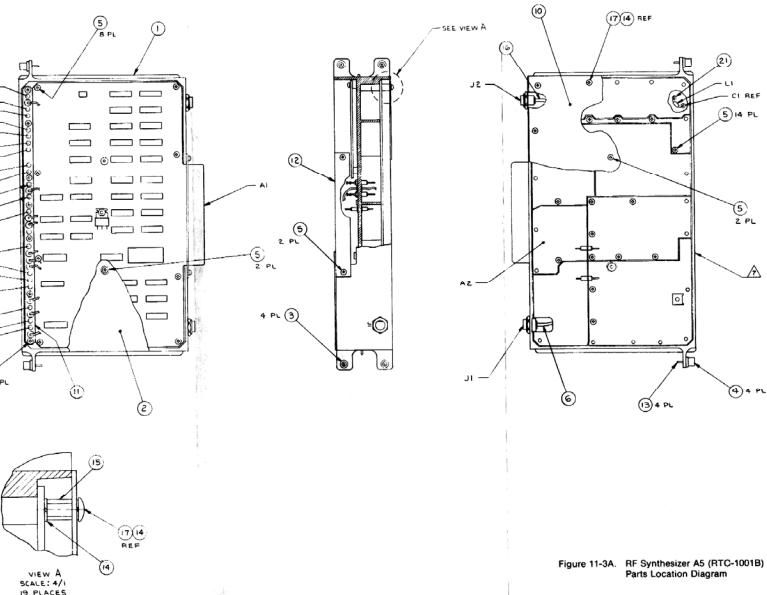

11-8. A Voltage Controlled Attenuator (VCA) follows the 550 MHz output to level the generator output for frequencies below 1 MHz. The leveling loop in the RF input module provides the ALC VOLT control signal to maintain the required output level at the front panel RF jack. See paragraph 5-31 for a further description of output leveling.

11-9. 500-1000 MHz Phase Locked Loop. The 500-1000 MHz output is locked to either the sum or the difference of the 310-440 MHz and 60.5 MHz loop output frequencies. In the locked condition, mixing the divide by two output of the 500-1000 MHz VCO's with the 310-440 MHz signal gives a difference frequency equal to the 60.5 MHz output. There are two frequencies at the divide by two output, the 310-440 MHz frequency plus or minus the 60.5 frequency, which will mix down to the correct frequency. However, the sense of the loop is inverted for one compared to the other. Thus the phase switch following the Phase/Frequency Detector determines at which frequency the loop will lock.

11-10. Modulation Control. Modulation of the tuning voltage for the 60.5 MHz VCO provides the frequency modulation of the RF output. Since the modulation sensitivity changes by a factor of two when the 250-500 MHz source is selected, the modulation control provides programmable gain control to maintain constant sensitivity at the FM MOD and SWEEP inputs. Additionally, the wideband modulation mode requires a gain of four beyond that for the narrowband mode. Thus under the control of the processor the Modulation Control selects between the SWEEP and FM MOD inputs, provides gains of 1, 2, 4, and 8 for the FM MOD input and gains of 1 and 2 for the SWEEP input. Input modulation sensitivities are 5 kHz/volt and 20 kHz/volt for narrow and wideband FM input and 2 MHz/volt for the sweep input.

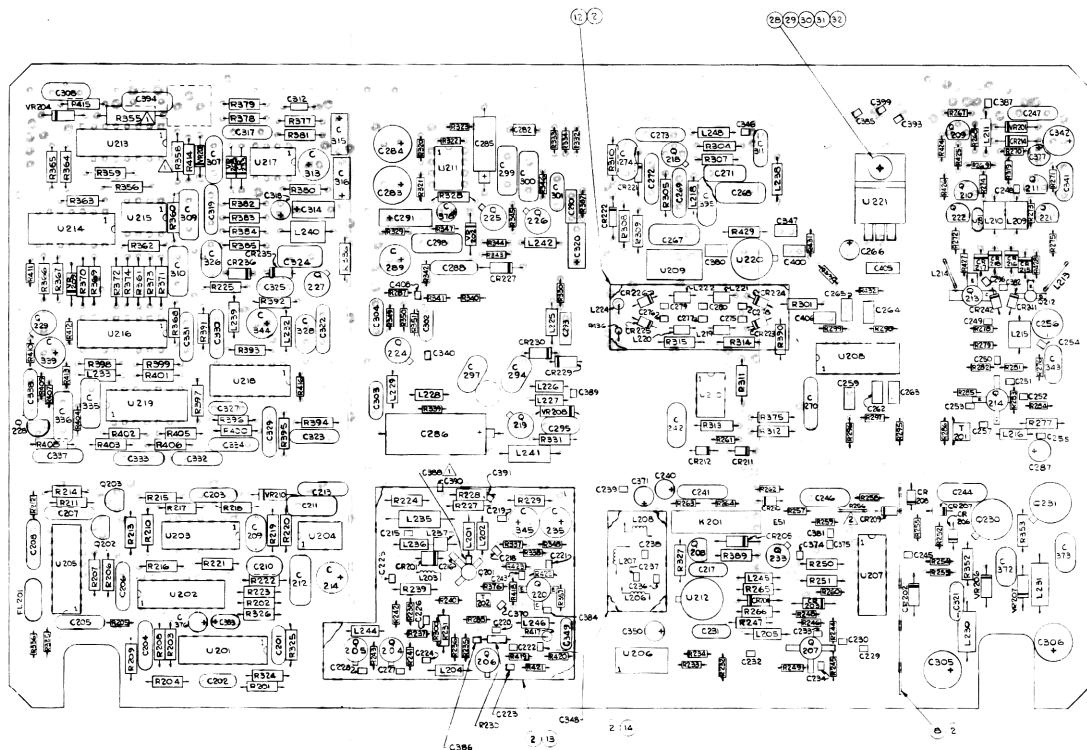

11-11. Module Control. Control information is latched in four bit control latches which are loaded by the processor through the RF control bus. The four bit RF ADD BUS 0-3 is decoded by the Address Decoder to determine which Control Latch the four bit RF DATA BUS 0-3 is to be stored. Synchronization of the data transfer is the function of the RF BUS EN line. Two decoded address outputs, RF LATCH 13 and 14, select latches on the receiver module for receiver control. One control latch output, LO/HI BAND SEL, goes to the RF Input module to control the frequency range of the output amplifier.

SECTION 12

AUDIO SYNTHESIZER (A6)

12-1. General. Generation, processing, and control of modulation audio is the function of the Audio Synthesizer module. Three modulation signals, private line, digital private line, and a fixed 1 kHz, are generated on the board. Processing for external microphone and BNC jack audio inputs as well as summation of all modulation sources to form a composite source is provided. Switching of the composite source to the appropriate modulator completes the function of the Audio Synthesizer. A block diagram of the Audio Synthesizer is shown in figure 12-1 with its schematic in figure 12-2.

12-2. Private Line Generator. Private line tones from 10 Hz to 10 kHz in 0.1 Hz increments are synthesized using a phase accumulative technique. Consider the 360 degrees in a cycle to be divided into 2^{20} pieces. A 20 bit digital accumulator incrementing at some fixed rate could then at any instant represent a fixed point in the 360 cycle. That is, if the accumulator was half full it would represent the 180° point and if totally full would represent the 360° point.

12-3. The number of times per second that the accumulator goes through its complete cycle determines the output frequency. If the increment rate is fixed, the time required to accumulate 2^{20} bits can be changed by changing the number of bits added at each increment time.

12-4. The PL synthesizer increments at a 104 857.6 Hz rate so that if only one bit were added each time, the time to complete one cycle would be 10 seconds. Processor loaded control latches determine the number of bits to be added at each increment time and thus the final output frequency. A 20 Bit Adder adds the control word to the current word in the 20 bit accumulator Latch. At the next increment time the Adder output is latched and becomes the next input to the Adder.

12-5. Conversion of the linear digital output of the 20-Bit Latch accumulator into a sinusoidal digital output is the function of the Decode ROM. A Digital to Analog (D/A) converter following the ROM converts the sinusoidal information into a quantized sinewave having a period equal to the cycle time of the 20-Bit Latch accumulator.

12-6. A bandpass filter with a 10 Hz to 10 kHz passband filters the quantized waveform to a sinewave having less than 1% distortion. The level of the sinewave is processor controllable by a programmable attenuator having 0, 10, 20, and 30 dB settings. The output of the PL generator is switched with the output of the DPL generator to give the INT MOD signal.

12-7. DPL Generator. The 23 bit Digital Private Line (DPL) word is generated by the processor from the 3-digit code. The 23-bit word is then transferred to a serial shift register and clocked out at a 133 Hz rate. Connecting the output of the shift register back to its input causes the 23-bit word to be continuously repeated.

12-8. A 133 Hz tone from the PL generator is the DPL clock input. For the DPL output mode the tone is gated to the clock input of the shift register by the Shift Register Control circuit. During the load mode the Shift Register Control gates a control latch to the shift register input. Twenty three data bits and clock pulses are then provided by the processor to load the DPL word. At the completion of the load mode, the Shift Register Control switches back to the output mode to cause the DPL word to be cycled through the shift register at the 133 Hz rate.

SECTION 14

IEEE INTERFACE MODULE (A8)

14-1. General. Remote control of the system is possible using a IEEE-488 bus and the IEEE Interface Module. The Interface Module provides the interface for the 488 bus and provides for processor control of most of the functions normally controlled from the front panel. A block diagram of the IEEE Interface Module is shown in figure 14-1 with its schematic shown in figure 14-2. See section 21 for information on the use of the IEEE Bus for system control.

14-2. IEEE Bus Interface. Bus buffering and interface protocol as defined by the IEEE-488 specification is provided for by the IEEE Bus Interface circuit. The system processor accesses the interface directly through its address, data, and control buses for reading from or writing to the IEEE bus.

14-3. RF Level Control. The RF Level Control circuitry selects between the 5 VDC + AM MOD or the AM MOD + DC REF (I) input for remote or local control respectively. For remote control the 5 VDC + AM MOD input is electronically attenuated to provide the requested RF output level. For local control the attenuator is programmed for unity gain so that the AM MOD + DC REF (I) signal from the front panel RF level potentiometer controls the RF output level.

14-4. For the IEEE control option, a electronically programmable RF step attenuator is installed in the system. Control of the attenuator is then from the processor through the Address Decode and Control Latch circuitry on the Interface Module.

14-5. Modulation Control. Each of the three modulation sources are individually controllable by the IEEE Bus Interface module. For remote control the respective modulation input (INT MOD (I), EXT MOD (I), and 1 kHz SINE) is switched to a programmable attenuator. The system processor selects the level of attenuation necessary to provide the requested level of modulation. For local control the attenuators are programmed for unity gain and the respective modulation signal from the front panel level control (INT MOD RTN (I), EXT MOD RTN (I), and 1 kHz SINE RTN (I)) is selected to the attenuator to provide modulation level control.

14-6. Address Decode and Control Latches. The system processor has direct control over the programmable attenuators on the module with the Address Decode and Control Latch circuitry. Control data on the data bus (D0-D7) is latched at the Control Latch indicated by the address bus (A0-A15).

SECTION 15

PROCESSOR MODULE (A9)

15-1. GENERAL. The processor module provides primary control and data manipulations for the system. This module contains a processor and buffer, a program memory (ROM), a nonvolatile memory (NVM), a random access memory (RAM), a peripheral interface adapter (PIA), a timing generator, and a character generator. Input and output information is via the peripheral interface adapter and the address, data, and control buses. A block diagram and a schematic diagram of the module is shown in figure 15-1 and figure 15-2, respectively.

15.2 PROCESSOR AND BUFFER. The processor is a Motorola microprocessor MC6802, operating at a 1 MHz clock rate. This microprocessor controls the processor module via the three signal buses. The address bus provides access to the selected device for data transfers (read/write) from the data bus. Synchronization of the data transfer and specialized processor functions are provided through the control bus.

15-3. PROGRAM MEMORY (ROM). The series of commands (program instructions) that direct microprocessor action are contained in the ROM (Read Only Memory). This ROM is comprised of two 8192×8 -bit read only memories. An additional 8192×8 -bit read only memory is provided with the IEEE option.

15-4. NONVOLATILE MEMORY (NVM). The nonvolatile memory provides storage for 1024 four-bit words. Data that is to be held during power off is held in the NVM, which consists of a battery backed RAM (Random Access Memory). When the power is turned on, the microprocessor reads the NVM contents to obtain its start up mode, the RF and tone memory presets, and the remainder of the preset data. If the operator changes a preset, the microprocessor changes the data in the NVM so that the new preset will be remembered.

15-5. RANDOM ACCESS MEMORY (RAM). The random access memory provides temporary storage for both the processor and the CRT alphanumeric display. The RAM has provision to store 1024 eight-bit words, of which 512 are used for the CRT display data. Data is written into and read out of the RAM by the microprocessor.

15-6. PERIPHERAL INTERFACE ADAPTER (PIA). The peripheral interface adapter provides input and output latches for external data from/to the processor module. There are nine inputs from the keyboard, four column inputs (KYBD COL 0-3), and five row inputs (KYBD ROW 0-4). A single input (IEEE OPT DET) signals the processor that the IEEE option is installed. The AF BUS EN 1 output signal synchronizes the transfer of data on the system AF control bus.

15-7. TIMING GENERATOR. The timing generator provides the timing signals for the character generator. All of the timing signals are synchronized to the 1 MHz master clock signal from the processor. A $\times 2$ multiplier provides a 2 MHz clock to the 8-bit shift register, which in turn provides the dot clock. Additionally, the 1 MHz is successively divided through a divide-by-four circuit then through a 12-binary counter to provide the remaining clock requirements.

15-8. CHARACTER GENERATOR. The character generator sequentially accesses that part of the RAM where character information is stored and causes the respective characters to be displayed on the screen. Since both the character generator and the processor share the same RAM, the two must be synchronized so they access the RAM during alternate half cycles of the master clock. The 1 MHz master clock signal, from the processor is used to synchronize the 2 MHz dot clock.

15-9. Characters are displayed on the CRT as eight-by-eight dot matrices. Thirty-two dot matrices, of which the last two are always blank, make one character line. Sixteen lines, of which the last line is always blank, complete the display area. Therefore, the total number of matrices available for character display is 30×15 or 450 matrices. The blank matrices and the blank line are used for horizontal and vertical retrace blanking, respectively. The display is generated by dot rows. As the CRT sweeps the first dot row of a character line, the character generator outputs a serial bit pattern of 1's and 0's that turn the crt intensity on and off. The result is a row of dots that when combined with the next seven rows form a character.

15-10. A select switch on the data and address buses to the RAM, toggles at the master clock rate of 1 MHz. This results in the processor and the character generator having access to the RAM alternately every other 0.5 microseconds. The processor stores RAM in the RAM an 8-bit word that represent the character to be displayed. The character generator stores RAM in sequence with the CRT display scan. As each location in the RAM is addressed, the 8-bit word stored at that location is read by the character generator. Several of the bits in the latch are applied to the character ROM, the eighth bit is not used. The timer generator provides 3 bits which indicates which row of dots are being scanned. The 10 bits applied to the character ROM, define a specific row dot of a particular character. An 8-bit timer, defined that a row of the character, is parallel-loaded into the shift-shift register. These 8 bits are serially shifted out of the register, at a 2 MHz rate, as the CHAR GEN X-AXIS output signal.

NOTES:

1. PARTIAL REFERENCE DESIGNATION ARE SHOWN. FOR COMPLETE DESIGNATION PREFIX WITH A9.
2. FOR REFERENCE DRAWINGS REFER TO EMBODIMENT D16165A D5241A
3. UNLESS OTHERWISE SPECIFIED:
ALL RESISTORS ARE IN OHMS,
±5 PCT., 1/4 WATT.
ALL CAPACITORS ARE IN UF.
ALL DIODES ARE AC.
4. DEVICE TYPE AND CONNECTIONS NOT SHOWN ON SYMBOL ARE LISTED IN TABLE 1. UNDERLINED PORTION OF THIS NUMBER IS THE IDENTIFICATION NUMBER AS PROVIDED BY THE MANUFACTURER TO IDENTIFY DEVICES ON DIAGRAMS.

-  U8 IS USED FOR IEEE CONFIGURATION ONLY.
EPMOS 74L2512
MUST BE PROGRAMMED WITH DATA PER
IEEE PROGRAM 98-P2016-A
-  U9 IS OPTIONAL
U37 IS OPTIONAL
-  U10 IS USED WITH U11 FOR
TREF5, TREF6 JUNCTIONS

SECTION 16

HIGH VOLTAGE POWER SUPPLY (A10)

16-1. GENERAL. CRT bias and drive voltages are provided by the high voltage power supply. The power supply converts a nominal 15 VDC input to output voltages of +4kV and a -2kV. In addition, control circuits for the CRT focus and intensity grids are contained in this power supply. The high voltage power supply block and schematic diagrams are shown in figures 16-1 and 16-2, respectively.

16-2. HIGH VOLTAGE SUPPLY. An 8 VDC at the center tap of the high voltage transformer is switched, through the transformer primary winding by the chopper, at a 20 kHz rate. The chopper drive signals originate in the low voltage power supply. One transformer secondary winding provides a 6.3 VAC CRT heater voltage. The other transformer secondary winding provides a 1 kV to a X4 multiplier and a X2 multiplier. The output of the X4 multiplier, a nominal +4 kV is the CRT anode voltage. A nominal -2 kV output of the X2 multiplier is applied to the intensity and focus modulators. The -2 kV is regulated by comparing a sample of the -2 kV to a 6.3V reference signal. The resultant signal controls the level of the DC input at the center tap of the high voltage transformer. A bias divider, on the transformer center tap, provides the HV CHOPPER BIAS signal to the low voltage power supply.

16-3. INTENSITY AND FOCUS CONTROL. An 87V zener diode and a resistive divider circuit provide the intensity and focus voltages. Each modulator provides variable output voltages, within their bias range, under the control of the low voltage INTENSITY TV and FOCUS TV input signals. The grid and focus voltages are stabilized by using DC control loops. The INTENSITY SAMPLE signal and the HV REF signal are compared, on the scope amplifier module, to an input control signal. The result of this comparison is the INTENSITY TV signal. In a similar manner, the FOCUS SAMPLE signal is compared, on the scope amplifier module, to the input control signal. This results in the FOCUS TV signal.

SECTION 17

RF INPUT MODULE (A11)

17-1. General. The RF Input Module is subdivided into three isolated circuits; input protection and power meter, wideband amplifier and frequency converter, and duplex generator. A block diagram of the RF Input Module is shown in figure 17-1 with its schematic shown in figure 17-2.

17-2. Input Protection and Power Meter. RF power to and from the system pass through this section to a common input/output RF connector (RF In/Out) attached to the module. In the generate or monitor operating modes the input protection relay is switched so that a low-loss 50-ohm path exists through the module. When the power monitor mode is selected, the WATT MTR EN line switches the relay so that the input is connected to a 50 ohm power termination. A detector across a portion of the load provides a DC level proportional to the input RF level. This level is amplified and made available to the system processor for the determination of input power. A terminal sensor monitors the load temperature and signals the processor when safe operating limits are exceeded. The processor in turn warns the operator that the RF input to the unit must be removed to prevent permanent damage.

17-3. If power in excess of 200 mW is applied to the system while operating in either the generate or monitor mode, the input is automatically switched to the 50 ohm load termination to protect the system. A signal line (INPUT PROTECT ACT) to the processor results in an audible and visual warning to the operator that the unit is in a protected mode. The warning ceases and normal operation resumes if the RF input is removed or if the power monitor mode is selected.

17-4. Wideband Amplifier and Frequency Converter. The wideband amplifier provides a leveled RF output from -3 dBm to +13 dBm in the generate mode and a +7 dBm LO drive in the monitor modes over the 10 KHz to 1 GHz frequency range. Primary components of the leveling loop are; the input VCA (Voltage Controlled Attenuator), the output level detector, and the level comparator. A level control voltage, proportional to the desired output level is compared to the actual output level as determined by the level detector. The result of the comparison steers the VCA maintaining the detected output level equal to the requested output level. In the generate mode the control voltage is obtained from the front panel RF level control (AM Mod + DC REF). For generate AM, the modulation signal is summed with the DC control level, causing the RF output level to follow the modulation signal. Also, in the generate mode the signal from the output level detector (CARRIER + MOD LVL) is made available for the determination of RF output power and percent of AM. A fixed reference voltage is switched to the level control input in the monitor modes giving a leveled +7 dBm local oscillator drive.

17-5. The VCA on the wideband amplifier board covers the frequency range from 1 MHz to 1 GHz. For frequencies below 1 MHz, the VCA select circuit clamps the VCA in the minimum position and enables a low frequency VCA in the RF Synthesizer. Coincident with the enabling of the low frequency VCA, the time constant of the output RF level detector is increased assuring proper operation down to 10 KHz.

17-6. The wideband amplifier output is relay switched between the local oscillator port of the input mixer for the monitor and generate DSBSC modes, and the RF attenuator for the generate mode. An RF sample from the mixer local oscillator output terminal, at a nominal level of -20 dBm, is provided to the duplex generator.

17-7. The frequency converter section consists of the input mixer, the first IF amplifier, and IF filters. In the monitor mode the desired signal is converted to 10.7 MHz by the input mixer. A two-pole input filter, IF amplifier, and a four-pole output filter select the 10.7 MHz component at the mixer output. The 10.7 MHz IF output of the converter is applied to the receive module.

17-8. For DSBSC generator the modulation audio is applied to the IF port of the input mixer through an isolation network. With the output of the wideband amplifier switched to the local oscillator port, a DSBSC signal is present at the RF port. Switching the Step Attenuator to the RF output port makes the DSBSC signal available at the RF output.

17.9. Duplex Generator. The Duplex Generator output is a frequency component that is offset from the system monitor frequency by 0 to 10 MHz or by 45 MHz. The offset is obtained by mixing the -20 dBm local oscillator signal from the wideband amp, which is already offset by 10.7 MHz, with a signal frequency from 10.7 MHz to 0.7 MHz or 34.3 MHz.

17-10. For the 3433MHz mixing signal, a single VCO is used. Tuning of the VCO is with the OFFSET FINE TUNE line from the front panel. Frequency modulation of the VCO is implemented by summing the OFFSET MOD signal with the tuning voltage.

17-11. For the 0.7 MHz to 10.7 MHz mixing signal a VCO with a frequency range from 35 MHz to 45 MHz is mixed with the 34.3 MHz VCO. The 35-45 MHz VCO is tuned by the OFFSET COARSE TUNE line from the front panel.

17-12. A sample of the offset frequency is made available to the frequency counter on the OFFSET FREQ line. The processor uses the frequency information to calculate and display the actual duplex frequency

SECTION 18

FRONT PANEL INTERFACE MODULE (A12)

18-1. GENERAL. The front panel interface module contains the input buffers for front panel control to the processor. In addition, buffering and ranging circuits for external scope vertical/horizontal, SINAD, DVM, and frequency counter inputs are in this module. A block diagram and schematic diagram of the Front Panel Interface Module is shown in figures 18-1 and 18-2, respectively.

18-2. Input Coupling and Ranging. Scope inputs to the Range Attenuator are from the front panel jack (EXT IN) or from the internal modulation sources (INT SCOPE TO RNG SW). An INT/EXT relay selects the input path. The external path may be AC or DC coupled and is also the path for external DVM, Frequency Counter, and SINAD inputs.

18-3. Four decades of attenuation from 1.0 to 0.001 are provided by the Range Attenuator. The input impedance of the attenuator is 1.0 megohm compensated for a bandwidth of 1 MHz. A unity gain buffer amp following the attenuator provides the drive for the DVM, Frequency Counter, and scope Vertical Preamp circuits.

18-4. DVM Buffer. For DC measurements the DVM Buffer provides a 2-pole low pass filter with a minimum of 30 dB attenuation at 50 Hz. For AC measurements the bandwidth of the buffer is switched so that the attenuation at 10 kHz is less than 0.5 dB.

18-5. Frequency Counter Preamplifier. The frequency Counter Preamplifier has sufficient gain for 30 mV rms sensitivity and provides hysteresis for noise immunity.

18-6. Scope Vertical Preamplifier. A calibrated gain of 50 or a variable gain from 5 to 50 is provided by the Vertical Preamplifier. The gain is controlled from the front panel. From vertical scope positioning the DC bias point of the preamplifier is controlled by the front panel position control. Deflection sensitivity at the VERT FROM RNG SW output is 0.5 volt per division.

18-7. Scope Horizontal Preamplifier. A fixed gain of 5 in the Horizontal Preamplifier gives a horizontal input sensitivity of 0.1 volt per division. Horizontal vernier gain is implemented on the front panel, and horizontal positioning on the Scope Amplifier module. Deflection sensitivity at the HORIZ TO SCOPE AMPL is 0.5 volt per division.

18-8. Control and Display Interface. Front panel control information is input to the processor in 4-bit groups through the AF control bus. Priority encoders convert the multiposition switch positions (scope horizontal, frequency scan, and RF step attenuator) to 4-bit codes. The processor sequentially addresses each input buffer (AF ADRS BUS 0-3) through the Address Decoder. Data in the selected buffer is then transferred to the processor on the AF DATA BUS 0-3 lines while the AF BUS EN₂ signal is low. Two additional latches provide the processor control interface for the Range Attenuator, input switching, and DVM Buffer control.

18-9. AF BUS. The AF Bus consists of a 4-bit tri-state bus data AF DATA BUS 0-3 and a 4-bit address bus AF ADD BUS 0-3. Individual input/output bus locations are addressed by AF ADD BUS 0-3. When AF BUS EN₂ is low, the function of the AF DATA BUS lines are determined by the address present on the AF ADD BUS lines.

18-10. LED CONTROL. Control output to the display, function, and modulation mode LEDs is by the AF BUS addressed 0, 1, and 2, respectively. Latch select outputs LS0, LS1, and LS2 are low to latch data present on the AF DATA BUS when the corresponding address is enabled on the AF ADD BUS. These latch select outputs and the AF DATA BUS are connected to the LED display board A14A1.

SECTION 19

10 MHz FREQUENCY STANDARD MODULE (A13)

19-1. General. The frequency Standard Module provides a stable 10 MHz source and the interface for an external 10 MHz input. A block diagram of the Frequency Standard Module is shown in figure 19-1 with its schematic shown in figure 19-2.

19-2. 10 MHz Oscillator and Control. The internal 10 MHz source is either a temperature compensated crystal oscillator (TCXO) or an optional ovenized crystal oscillator (OVXO). A voltage regulator on the module supplies the voltage to the oscillator and monitors the supply current. For the ovenized option, at power on, the oven draws high current. As the oven warms up the current decreases, reaching some low value when the operating temperature has been reached. A current detector illuminates the oven ready indicator when the current has decreased to the stabilized value. The indicator is continuously illuminated with the TCXO.

19-3. Internal/External Switchover. With no signal at the external 10 MHz input jack, the internal oscillator is gated to the SYNTH 10 MHz and the external 10 MHz OUT signal paths. When an external 10 MHz input is applied the switchover circuitry detects its presence, removes the power from the internal oscillator, and gates the external input to the SYNTH 10 MHz and external 10 MHz OUT signal paths. The oven ready indicator is extinguished when the system is operating from an external standard.

SECTION 20

FRONT PANEL (A14)

20-1. GENERAL. The front panel assembly consists of a display board module and the analyzer operating switches and controls. A schematic diagram of the front panel assembly is shown in figure 20-1.

20-2. DISPLAY BOARD. The display board holds and decodes LED data. A display of 27 LEDs is driven by 24 drivers and three inputs from external sources. The keyboard is a 5-row by 4-column matrix of momentary contact switches. Jumper connections on the board are used to route signals between connectors. The display board consists of three latch/decoders, 24 LED drivers, and a 27 LED display. A display board block diagram is shown in figure 20-2.

20-3. The three latch/decoders hold and decode input data from the AF DATA BUS 0-3. Signals $\overline{LS0}$ - $\overline{LS2}$ are latch selects that transfer data from the AF DATA BUS 0-3 to the corresponding latch. Only one LED at a time can be turned on by any of the three latch selects. Each driver is an open-collector device which sinks current through its respective LED.

SECTION 21

IEEE — 488 BUS CONTROL

21-1. INTRODUCTION

21-2. The IEEE Interface Option enables the use of the Communications System Analyzer as a programmable measurement instrument. When combined with a suitable programmable controller and applications software, the major functions of the analyzer can be controlled or monitored via an IEEE-488 standard digital interface. Thus, repetitive test routines can be performed and the data recorded quickly and accurately with little operator interaction.

21-3. The interface characteristics conform to the specifications of the IEEE Standard Digital Interface for Programmable Instrumentation (IEEE Standard 488) which defines both the electrical and the mechanical interface. Control protocol is also defined by the specification. Control commands which are unique to the analyzer are described in detail in the following paragraphs of this section.

21-4. The controller for this application should be capable of reading and writing ASCII and control characters from and to the bus in accordance with the 488 specification. Application software is the user's responsibility as dictated by the controller selected, although interface and application assistance is available from Motorola.

21-5. The IEEE option package consists of an IEEE Interface module (A8) with a rear panel connector, an electrically programmable RF attenuator in place of the step attenuator on the RF Input Module (A11), a fourteen position rotary switch on the front panel in place of the step attenuator shaft, and one additional ROM memory IC on the Processor module (A9).

21-6. While in the local mode the IEEE-488 equipped system operates and performs the same as a standard system, except the maximum RF output level is reduced to +11 dBm from +13 dBm. However, when the Remote Enable (REN) line on the IEEE Bus is activated many of the front panel controls are disabled and their functions placed under bus control. Refer to table 21-1 for a listing of those functions which can be controlled or monitored via the 488 Bus.

Table 21-1. IEEE-488 Interface Controllable Functions

Control/Measurement	Comment
Function Settle	Generate/Power Monitor/Monitor
Modulation Control	Continuous/OFF/BURST
Wideband/Narrowband Switch	
Image High/Low Switch	
Duplex Oscillator Switch	0-10 MHz/OFF/45 MHz
Keyboard	Can be entries 0-9 - Can be entries A-F - Can be entries 0-9 - Can be entries A-F -
Display Mode	General/Monitor Metering Spectrum Analyzer Duplex Generator IR Memory Tone Memory Frequency Counter DMM External Wattmeter IP Scope AC Scope DC Remote Terminal Mode Unit can also display a subset of ASCII characters: 0-9, lower case letters A-Z, plus other symbols - ASCII characters Hexadecimal Hex - decimal enables display of operating frequency, DTMF display in a transparent ter- minal mode
Function Mode	(Note 1) CW SSB/DSB SW 1-10 MHz SW 20-21-1 MHz
Code Synthesizer Mode	P/CPL P/CPL Invert Tone A Tone B Time Sequence Tone Remote

Control/Measurement	Comment
RF Frequency	Frequency entry to be supported by program.
PL Frequency	Frequencies not available in memory table
Tone A Frequency	
Tone B Frequency	
Time Sequence Select	Sequences 1 through 5 only (Note 2)
Wattmeter Element Select	
External Modulation	Modulations available to any instrument
Code Synthesizer Modulation	(0-20 KHz deviation in 10 Hz steps); (0-100 KHz deviation in 10 Hz steps); (0-1000 KHz deviation in 100 Hz steps) (Note 3)
RF Level	RF level switchable to any displayable level (-127 to +11 dBm in 1 dB steps) (Note 4)
Scope Vertical Step Attenuator	0.01, 0.1, 1, 10 volts
Horizontal Scope Sweep	1, 10, 100 microseconds
Input Power Meter	External
Frequency Error	
Decibel Scale	
% AM + or -	Reading returned as displayed remote (Note 3)
External DVM (AC/DC)	
External Frequency Count	
External Power Meter FWD/REV	

NON-CONTROLLABLE FUNCTIONS

Since control and monitor functions of the interface are implemented in the interface due to their local operator orientation. A list of these operator oriented controls are as follows:

Power On/Off	Scope Vertical Position	Deviation Limit
Power Mode Indicators	Scope Horizontal Position	Battery Voltage Reading
Display Focus	Receiver Squelch	Deviation Limit Alarm (Disabled Under Remote Control)
Display Focus	Receiver Volume	Under Remote Control
Display Focus	Zero Beat Indicator	Antenna 0 Indicator
Display Focus	RF Scan	Battery Below Low Warning
Display Focus	RF Memory Table	BFO Frequency Adjust
Display Focus		Offset Oscillator Adjust
Display Focus		Mobile Telephone Tone 1 and Tone 2 Frequencies

21-2

21-7. IEEE-488 BUS STRUCTURE

21-8. The following discussion briefly describes the 488 Bus operation. It is not a complete definition of the total bus structure or capability. For complete information a copy of IEEE Standard 488 should be obtained.

21-9. **Bus Signals.** The IEEE-488 Bus consists of 16 parallel lines. The lines are divided into three groups. Lines D101-D108, Data Input/Output, form the 8-bit data bus for the bidirectional transfer of control and ASCII characters. Three handshake lines, Data Valid (DAV), Not Ready for Data (NRFD), and Not Data Accepted (NDAC), control the transfer of data on the data bus. The remaining five lines can be termed the bus management lines with functions as follows:

- Attention (ATN)
- When true the data bus carries an address or a command when false it carries data
- Interface Clear (IFC)
- When true all devices on the bus are placed in a known quiescent state.
- Service Request (SRQ)
- Indicates a device on the bus needs service.
- Remote Enable (REN)
- Enables the remote control feature of the devices on the bus.
- End or Identify (EOI)
- Indicates the end of a multiple byte transfer.

21-10. **Data Transfer.** Each byte of data that is transferred across the data bus is synchronized with a handshaking procedure. This procedure allows devices with different data transfer rates to share the same bus. The handshake cycle starts when the source device which has data to transfer checks for a false condition on the NRFD line. When NRFD is false, all devices on the bus are ready to accept data. The source then puts the data onto the data bus and sets the DAV to a true state. The acceptor device accepts the data, then sets its own NRFD to a false state, and when ready sets the NDAC line to a true state. Because the NRFD and NDAC lines are wire-Ored the lines do not return to the false state until all devices on the bus have released the line. Thus the slowest device on the bus determines the transfer rate. When the NDAC line goes false the source devices set the DAV false which in turn causes the acceptor devices to set the NDAC line true. When the acceptor devices have completed processing the data byte just received they allow the NRFD line to go to the false state completing the handshake. As the data transfer continues the cycle repeats for each data byte.

21-11. **Bus Address.** Each device on the bus is assigned a four bit address by the programmer. The address assigned to the device is set by an address switch within the device. On the analyzer the address switch is on the IEEE Interface Module. Only the top four switches are used to set the address. The fifth switch is unused. To set the address use the binary equivalent of the address number and set the switches to the ON position for a logic 1. The least significant bit is the top switch.

21-12. Programming

21-13. Programming the system analyzer consists of first addressing the unit as a listener, transferring the control commands to the unit, and then sending a command termination sequence. To obtain data from the system, the pertinent control commands are first transferred to the unit and then the unit is addressed as a talker. As a talker the system outputs onto the bus the data requested by the control commands.

21-14. The bus controller is the central part of the automatic system. The program, consisting of sequences of analyzer control commands and sequences of controller instructions for handling the return data, is contained within the controller. The user must initially write the program so that the desired test sequences and data outputs will be obtained. The following paragraphs define the instruction set and data formats that can be used to control or will be returned from the system analyzer. The user must insure that the controller is compatible with the IEEE-488 Standard bus and that its program is correct for the instruments on the bus.

21-3

21-15. Command Structure. Each command consists of a two letter definition prefix followed by a numeric data field. The data field will vary in length and structure according to the definition prefix as shown in table 21-3. Spaces may be inserted anywhere in the command but are not required. Each letter or number of a command is transferred from the bus controller to the analyzer in ASCII format. ASCII defines a 7-bit digital code for each letter, number, and symbol commonly used in computer programming.

21-16. The first letter of the two letter prefix identifies a command category with the second letter identifying a particular command within that category. A listing of the command categories and the corresponding first letter is provided in table 21-2. A complete list of commands is shown in table 21-3.

Table 21-2. Command Categories

A	Audio Synthesizer
C	Control
F	Frequency Counter
G	Generate/Monitor Control
K	Keyboard
M	Modulation
O	Oscilloscope
R	Receiver
V	Voltmeter/Distortion Analyzer
W	Wattmeter

21-17. The data field is comprised of five sub-fields as shown:

Data limits and accompanying units are given in table 21-3. The data field is optional or not allowed for certain commands.

21-18. Data Sign. The data sign is a single '+' or '-' character indicating the sign of the data value. The sign may be omitted for positive value data.

21-19. Data Value. The data value field is restricted to the numbers '0' through '9' and '.'. A maximum of five digits to the right and to the left of the decimal point are allowed. The decimal point can be omitted for integer values. If the value field is omitted, it is assumed to be zero.

21-20. Exponent. The presence of the "E" character in the exponent field indicates that the data value is to be multiplied by 10 raised to the power following the "E" character. If the "E" is omitted the exponent is assumed to be 10^0 or 1.

21-21. Exponent Sign. The exponent sign is a single + or - character and can be omitted for positive exponent values.

21-22. Exponent Magnitude. The exponent magnitude is a single character 0 through 9. If the exponent magnitude is omitted, it is assumed to be zero.

21-23. The following are examples of correct data fields for the value 12.34:

0.1234 E+2	+ 0.1234 E2	1234 E-2	1234.E-2
+ 12.34	12.34E	+ 1234 E-2	12.34 E0

21-24. **Command Strings.** A command string consists of either a single command or multiple commands in succession with or without embedded spaces. A command string must be terminated with a carriage return and a line feed character.

21-25. **Command Types.** Each command is one of three basic types, control selects (C), data entry (D), and output requests (O). Type information for each command is listed in table 21-3.

21-26. **Control Selects.** Control select commands select front panel switch settings. Some of these commands do not require accompanying data, such as toggle switch commands.

21-27. **Data Entry.** Data entry commands replace manual entry of data through the keyboard. All of these commands require data in the data field.

21-28. **Output Requests.** Output request commands allow data that is normally displayed on the CRT to be transferred to the controller. Accompanying data is not required with output requests. The data limits and units listed in table 21-3 for these commands refer to the return data. Output request commands cause the analyzer to go to the proper display, function, and mode to acquire the designated reading. These states are listed in table 21-3. The measurement however, is not made until a trigger command 'T' has been sent from the controller. The trigger command causes the measurement to be made and the data held for transmission to the controller. Then when the controller addresses the analyzer as a talker the data is output to the controller. A reading can be retaken for any number of triggers without repeating the output request. The request is lost however, when any command changing the display, function, or mode is sent.

21-29. **Trigger Command.** The trigger command is the exception to the two character command prefix. This command is simply the letter 'T' usually sent immediately following the output request command. If no output request is pending, the trigger command is ignored.

21-30. **Return Data.** The data returned from the analyzer is formatted similar to the control data as shown.

DATA SIGN DATA VALUE EXPONENT SIGN EXPONENT MAGNITUDE

The data is always returned in this format with a single exception. Data for the "RP", signal present, command is returned as a single digit having a value of "0" or "1".

21-32. **Data Value.** The data value is 1 to 5 digits in length with leading zero suppression and no decimal point.

21-33. **Exponent and Exponent Sign.** The letter 'E' followed by a '-' character is always transmitted with return data.

21-34. **Exponent Magnitude.** The exponent magnitude is a single digit with a value from 0 to 9. The digit indicates the negative power of ten that is to be multiplied with the data value to obtain the units listed in table 21-3.

21-35. **Programming Commands.** Table 21-3 lists the programming commands available for the system analyzer. The table identifies the category and type of command, the data limits and units, the command function, and any display, function, or mode change that would occur.

21-36. **Terminal Mode.** When the command CD12' is used, the system terminal mode is enabled. The terminal mode allows the analyzer's CRT display and keyboard to perform as a limited function I/O terminal. Possible uses for the terminal mode would be to provide test instructions to a test operator at an auto test station.

21-37. **Display Format.** Once the CD12' command has been sent the terminal mode has been entered. All further ASCII valid characters sent from the controller will appear on the CRT display. The total display area on the CRT is 15 lines of 30 characters each. Character entry on the CRT is on the bottom line. Each line feed character causes the bottom line to move up one place. If more than 30 lines are entered, the top lines are lost off the top of the display. A list of valid ASCII characters for the display is provided in table 21-4. All invalid characters are ignored in the terminal mode.

21-38. **Keyboard Entry.** In the terminal mode the keyboards on the analyzer may be used to input data to the bus controller. The ten numeric keys and the left cursor key have predefined ASCII characters. The character corresponds to the number on the key for the numeric keys. For the left cursor key, carriage return and line feed characters are sent. The down cursor key causes a bus service request to be generated regardless of the operating mode. This key could be used to halt an automatic test sequence.

21-39. The remaining pushbuttons are defined, prior to entering the terminal mode, with the use of the keyboard control commands listed in table 21-3. Each key is assigned an ASCII character by following the Kn command prefix with the decimal equivalent of the binary ASCII code for that character. A list of valid ASCII characters and their binary and decimal equivalents are listed in table 21-4.

21-40. Data that is entered from the keyboard is stored in a 9 character buffer until addressed by the bus controller. If more than 9 keypresses occur before the controller accesses the analyzer, the excess inputs are lost. Once the controller has addressed the analyzer, the analyzer transmits the character data to the controller. The analyzer will continue to transmit, or hold up the bus handshake if no keys have been pressed, until the left cursor key is pressed. Thus every data string entry from the keyboard must terminate with the left cursor key. As the data is transmitted to the controller it is also entered onto the CRT display.

21-41. **Terminal Mode Exit.** An ASCII end of transmission character (EOT) sent from the controller will terminate the terminal mode. When the mode is terminated the analyzer returns to the Gen/Mon Mtr display, and is ready to accept new command inputs.

21-42. **Error Messages.** Error messages are generated by the analyzer to help the programmer troubleshoot his program. As control commands are received by the analyzer, they are decoded to determine the command sent. If the analyzer is unable to decode the command it generates an error message and ignores all succeeding commands. To clear the error condition the bus controller must address the analyzer as a talker so that the error message will be transferred to the controller.

21-43. The format of the error message is:

21-8

ERROR nn (CR)(LF)

The two digit number nn defines the error condition as listed in table 21-5. The carriage return (CR) and line feed (LF) characters are the termination sequence used by analyzer whenever it transmits information. All characters are ASCII coded.

Table 21-5. Error Messages

Error Code	Condition
00	Data requested without trigger
01	Invalid mnemonic prefix
02	One character mnemonic (not T)
U3	Invalid mnemonic suffix
04	Exponent overflow
05	Data underflow
06	Data overflow
07	Data transmitted, not allowed
08	Invalid data
09	RF input power exceeded
10	Level or mod required

21-44. To effectively utilize the error message capability of the analyzer it is necessary to address the unit as a talker after the transmission of each command. The bus controller must then be programmed to recognize the error message and to determine the error number. A successful data transmission will send back an error code 00 when addressed as a talker. The controller should be programmed to ignore error 00 and to display any other error to the operator. Of course if a valid output command followed by the trigger command was sent, the talker address will result in the requested data being output to the controller.

21-45. **Service Requests.** There are only two conditions that will cause the analyzer to generate a service request (SRO). If a SRO is generated it must be cleared by a serial poll of the analyzer. The serial poll is a bus command which results in a data byte being sent to the controller from the analyzer. The data byte indicates the cause of the SRO. Table 21-6 lists the SRO causes and the corresponding serial poll data.

Table 21-6. SRO Data

21-9

21-46. **Programming Considerations.** The flexibility of the IEEE-488 option is reflected in the number of programming commands. To use these effectively and efficiently, certain programming practices should be followed. The following paragraphs present the major considerations for effective programming.

21-47. **General.** Overall, programming the analyzer involves the same steps as are involved when using it manually. A program can be fairly easily obtained by first performing the desired test sequence manually noting each time a setting is changed and a reading made. The program is then simply a duplication of the manual steps with control commands substituted.

21-48. **Generate Mode.** For accurate level control it is best to specify the generate frequency prior to the RF output level. For example, the command string:

CGGGFOOGLS

sets the generate mode, a frequency of 100 MHz and an output level of +5 dBm.

21-49. **Code Synthesizer.** Before enabling the output of the code synthesizer with an MS, ME, or MK command, all the necessary parameters must first be defined. Table 21-7 lists the modes and their controlled parameters that need to be defined. It should be noted that these parameters do not need to be defined each time a mode is selected, only when they are to be changed for that mode.

21-50. **Always select a tone mode before selecting a tone sequence ie: command an AM before AS as in AM4**

AS6 for "Sel. V, EEA" sequence.

21-51. Both sequence 3 and sequence 4 in tone mode 1 (A/B) are user selectable. This means that the A/B User's Sequence from Table 21-7 could also read A/B User Sequence AM1ASAXIAY1AZ1MM2MSM3MM4.

21-52. When selecting AM3 (mobile telephone sequence) it is not possible to modify the frequency of the tones with the AA or AB commands. The frequency of the tone can only be changed through manual entry. When the analyzer is powered up, the frequency of the tone is whatever was last entered manually and retained in the non-volatile memory.

21-53. To set up a code synthesizer level (AM depth or FM deviation) with the MS command it is necessary to first select tone A or tone B (MM2 or MM3). Therefore, always request MM2 or MM3 before setting up a level with the MS command. If a tone sequence is desired, follow the MS command with an MM4 or MM5.

Table 21-7. Code Synthesizer Programming Considerations

Output	Command String	Effect
DPL Code	CF0AD131MM0MS3	FM, DPL Code 131, 3 kHz FM
DPL Inverted Code	CFAD31MM1MS5	FM, DPL Code 313, 5 kHz FM
PL Code	CP2AP60_5MMMS30	AM, PL60.5 Hz, 30% AM
Tone A	CAFA23MM2MS3	FM, 2000 Hz, 3 kHz FM
Tone B	CAFAB2000MM3MS3	FM, 2000 Hz, 3 kHz FM
Tone Remote	CAFAA1SE3A3000MM1MM2MS3MM5	FM, Mod 1, A = 1500 Hz, B = 300 Hz, 3 kHz FM
A/B Standard Sequence	CAFAM1AS1AA1E3A82E3MM2MS3MM5	FM, Mode 1, seq, 1, A = 1 kHz, B = 2 kHz, 3 kHz FM
A/B User Sequence	AM1, AS3A1AY1AZ1MM2MS3MM4	1 sec. on/off times, 3 kHz FM
6 Tone MM Sequence	AM2AS2AF1-2345MM2MS3MM4	Preamble & 6 tones, 3 kHz FM
Mobile Tel. MTS seq	AMAS2AT182038MM2MS3MM4	Preamble & 7 digits, 5 kHz FM
CLR 100MS Set V seq	AMMAS4V98765MM3MSMM4	5 tones, 5 kHz FM

21-11

21-54 Modulation. The system analyzer is capable of receiving with three simultaneous sources. The commands ME, MK, and MS only affect their individual portion of the total output. Thus to avoid inadvertently having an unwanted modulation source enabled it is recommended that all three source values be defined together. For example:

CFMKMSME20

selects the FM mode, disables the 1 kHz and code synthesizer modulation, and set 20 kHz deviation from the external input. The external input must be applied to the analyzer prior to sending this command.

21-55. For the generate AM mode the frequency and output level must be defined prior to selecting the modulation level. The following command string is of the proper sequence to obtain 30% AM at 100 Hz with a level of -100 dBm:

CGGF0001:100MEMSMSMK30

21-56. The bandwidth control commands, RN and RW, range the generate FM modulator sensitivity. For greater resolution and faster set up time for deviations less than 20 kHz use the narrowband 'RN' command. Above 20 kHz deviation the wideband 'RW' command must be used.

21-57 Either upper or lower case letters can be used in programming the analyzer. In the terminal mode, lower case letters will appear as upper case letters on the CRT screen.

21-58. Measurements. To obtain correct monitor mode data it is necessary to first set the frequency, bandwidth, and image prior to making the reading. Thus, it is a good practice to always place the request for a reading as the last command in the string. For example the command string CMNRHGFPSRET

selects the monitor mode, narrowband, high image, and 95.5 MHz center frequency. The 'RET' command asks for a frequency error reading and triggers the analyzer so that the reading will be made.

21-59 R2002C Analyzer Configuration

The R2002C analyzer differs in configuration from the standard R2001C in the following manner:

A11 Module: The manual attenuator AT1 is replaced with a programmable version. A new ribbon cable assembly connected to the A8 module provides control signals for the attenuator.

A9 Module: Additional memory for the IEEE program is added by adding U8.

Front Panel Assembly A14: Rotary switch S19 is added for control of the RF Input/Output level.

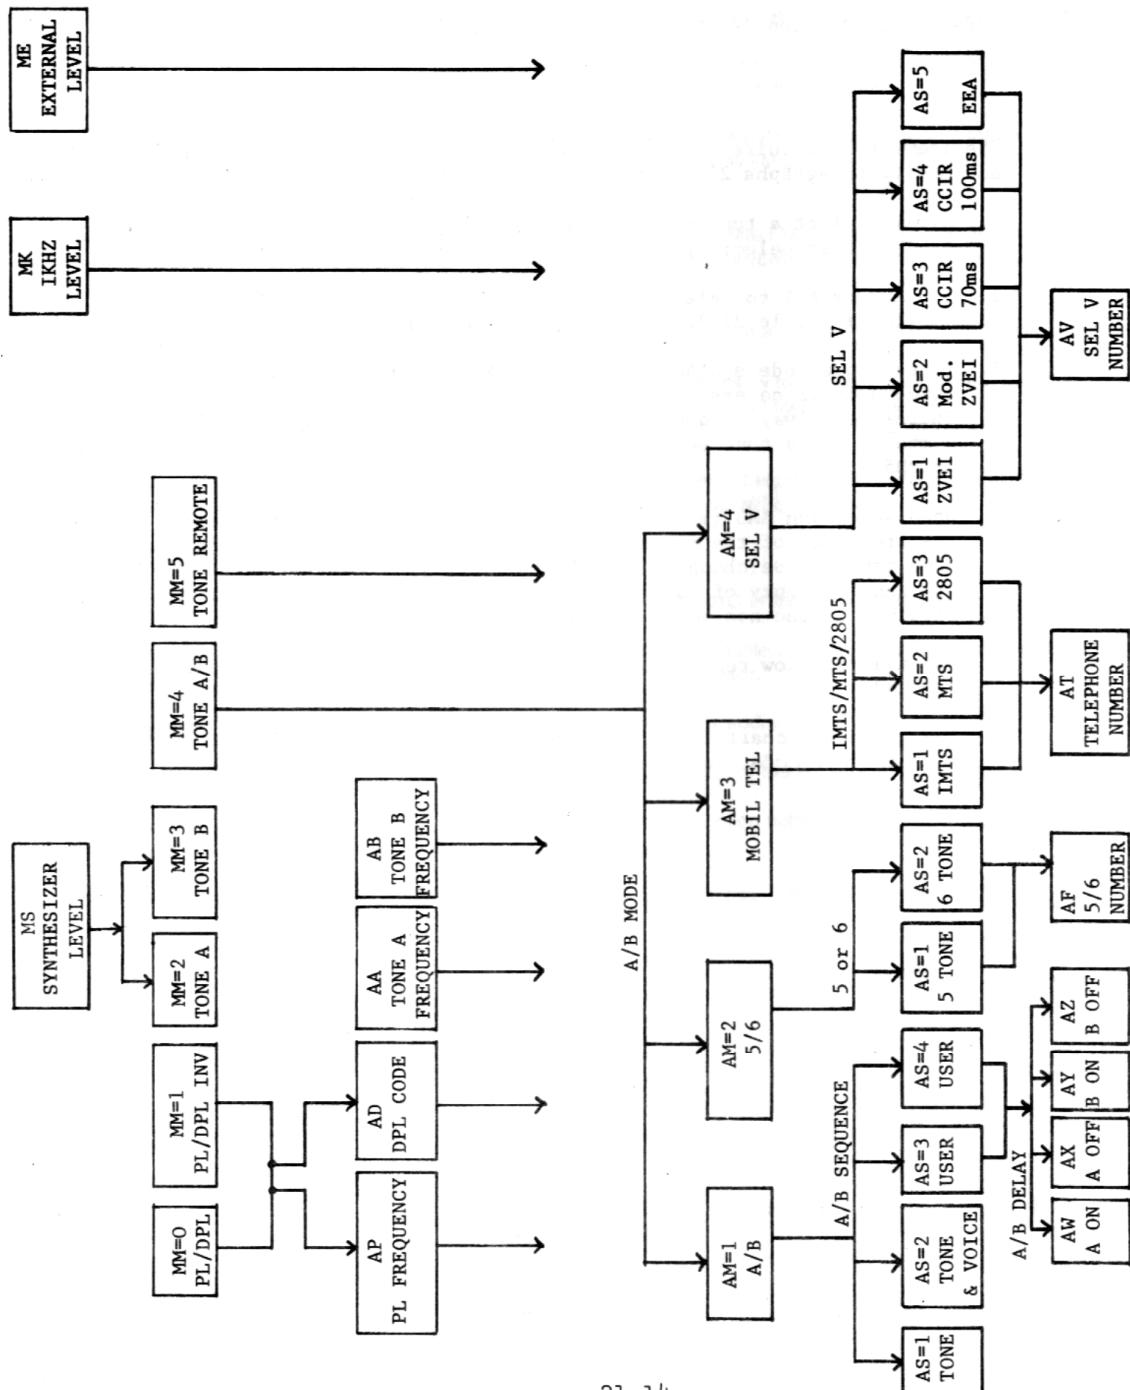

Module A8 is added to the analyzer (see Section 14 for details). Ribbon cable assembly is added from the A8 module to the rear panel of the analyzer to provide I/O signals.

For conversion of R2001C to R2002C, contact your local area test equipment sales office.

Addendum to Section 21 68-81069A99-0

The items that require clarification relate to the code synthesizer functions and modify paragraphs 21-48 thru 21-50 as follows:

1. Always select a tone mode before selecting a tone sequence, i.e.: select an AM before selecting AS (table 21-7, last five examples are in error)
2. Use AS3 or AS4 to select A/B delay (AW, AX, AY, AZ). AS5 is no longer available (table 21-7, last example is in error).
3. To set up a code synthesizer level (AM depth or FM deviation) with the MS command it is necessary to select tone A or tone B first (AM2 or MS2). Therefore, always request AM2 or MS2 before setting up a level with the MS command. If a tone sequence is desired, follow the MS command with an AM4 or MS3.
4. When selecting AM3 (mobile telephone sequence) it is not possible to modify the frequency of the tones with the AA or AB commands. The frequency of the tone can only be changed through manual entry. When the analyzer is powered up, the frequency of the tone is whatever was last entered manually and retained in the non-volatile memory.
5. The analyzer now recognizes lower case letters in terminal mode and in commands.
6. The following chart is enclosed to clarify the various functions available with the new code synthesizer.

COMMUNICATIONS SYSTEM ANALYZER

68P81069A99-O

MOTOROLA INC.
Communications
Group

MOTOROLA BATTERY PACK

MODEL RTP-1002A

1. DESCRIPTION

The RTP-1002A is a battery pack and charger designed to be mounted to the back of the R-2001 Communications System Analyzer. The unit contains battery capacity to operate the R-2001 for approximately one hour. A constant current charging system is capable of recharging the batteries in 16 hours.

2. OPERATION

2.1 The RTP-1002A Battery Pack is automatically engaged when no ac power is present, and the power switch is either in the ON or STANDBY positions. When ac power is applied, the R-2001 automatically switches the RTP-1002A Battery Pack out of the circuit and draws its power from the ac power source.

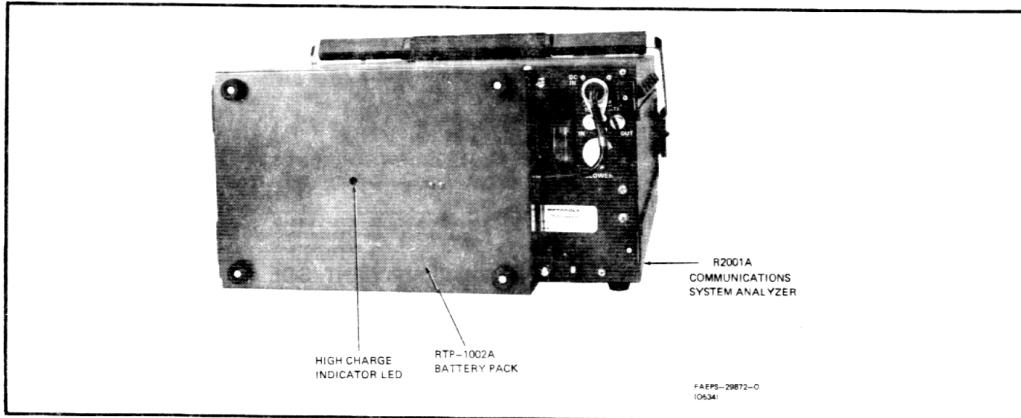

2.2 When the power switch is in the OFF or STANDBY position and ac power is applied to the R-2001, the RTP-1002A Battery Pack draws dc current from the R-2001 to activate the charging circuit. The charging circuit delivers approximately 750 mA of current until the battery voltage reaches 14 volts. As the

battery voltage reaches 14 volts, the current drops to approximately 25 mA and the high-charge indicator LED extinguishes.

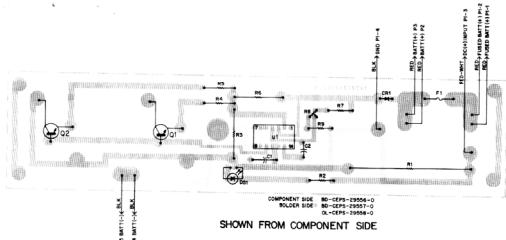

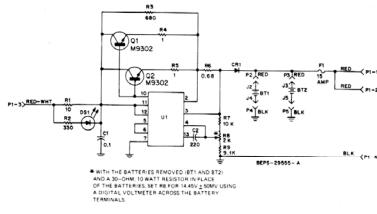

2.3 When the R-2001 systems analyzer is used with the RTP-1002A Battery Pack, it is recommended to keep the power switch in the STANDBY position whenever possible. This extends the time the battery is able to operate the R-2001 Communications System Analyzer. The low trickle charge rate enables the batteries to be left on charge indefinitely without damage due to overcharging.

CAUTION

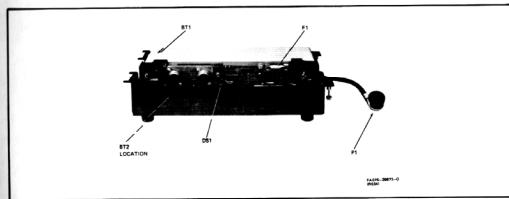

Do NOT permit battery discharge below 10.4 V dc as indicated on CRT in DVM display mode; immediately turn unit "OFF". Allowing battery discharge below this level may result in permanent damage to the battery. The R-2001 should be plugged into ac power (117/234 V ac) with the power switch in "OFF" or "STANDBY" position to recharge the batteries.

RTP-1002A Battery Pack Mounting Detail

parts list

REFERENCE SYMBOL	MOTOROLA PART NO.	DESCRIPTION	PL-6816-A
BT1, 2	60-803404AB	battery, 12V	
C1	8-620961-1B	capacitor, fixed: 1 μF ± 10%; 50V	
C2	21-839961-10	capacitor, fixed: 0.001 μF; 50V	
CR1	48-825265G	diode, zener: 1.3V	
DS1	48-8001905	light emitting diode: LED	
P1	60-804006	IC, 8-pin DIP	
Q1, 2	48-869302	transistor (See Note) NPN	
R1	17-803444-01	resistor, fixed: ± 10%; 1/4 W unless otherwise stated	
R2	8-124257	230	
R3	8-124258	495 ± 1%	
R4, 5	6-126870	1 ± 5% 12 V	
R6	6-126871	10K ± 5% 12 V	
R7	6-124473	10K ± 5%	
R8	6-124474	10K ± 5% 12 V	
R9	6-124472	9.1K ± 5%	
		Integrated circuit (see note)	
P1	51-80342409	MC1725L	

Note: For optimum performance, replace diodes, transistors and integrated circuits must be ordered by Motorola part numbers.
